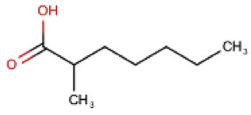
Version: 040218. This version replaces any previous versions.
Name: 2-Methylheptanoic acid
CAS Registry Number: 1188-02-9



Abbreviation/Definition List:

2-Box Model - A RIFM, Inc. proprietary *in silico* tool used to calculate fragrance air exposure concentration
AF - Assessment Factor
BCF - Bioconcentration Factor
Creme RIFM Model - The Creme RIFM Model uses probabilistic (Monte Carlo) simulations to allow full distributions of data sets, providing a more realistic estimate of aggregate exposure to individuals across a population (Comiskey et al., 2015, 2017; Safford et al., 2015, 2017) compared to a deterministic aggregate approach
DEREK - Derek Nexus is an *in silico* tool used to identify structural alerts
DST - Dermal Sensitization Threshold
ECHA - European Chemicals Agency
EU - Europe/European Union

* Corresponding author.
E-mail address: gsullivan@rifm.org (G. Sullivan).

https://doi.org/10.1016/j.fct.2018.08.051
Received 17 April 2018; Accepted 22 August 2018
Available online 24 August 2018

GLP - Good Laboratory Practice
IFRA - The International Fragrance Association
LOEL - Lowest Observable Effect Level
MOE - Margin of Exposure
MPPD - Multiple-Path Particle Dosimetry. An *in silico* model for inhaled vapors used to simulate fragrance lung deposition
NA - North America
NESIL - No Expected Sensitization Induction Level
NOAEC - No Observed Adverse Effect Concentration
NOAEL - No Observed Adverse Effect Level
NOEC - No Observed Effect Concentration
NOEL - No Observed Effect Level
OECD - Organisation for Economic Co-operation and Development
OECD TG - Organisation for Economic Co-operation and Development Testing Guidelines
PBT - Persistent, Bioaccumulative, and Toxic
PEC/PNEC - Predicted Environmental Concentration/Predicted No Effect Concentration
QRA - Quantitative Risk Assessment
REACH - Registration, Evaluation, Authorisation, and Restriction of Chemicals
RfD - Reference Dose
RIFM - Research Institute for Fragrance Materials
RQ - Risk Quotient
Statistically Significant - Statistically significant difference in reported results as compared to controls with a $p < 0.05$ using appropriate statistical test
TTC - Threshold of Toxicological Concern
UV/Vis spectra - Ultraviolet/Visible spectra
VCF - Volatile Compounds in Food
VoU - Volume of Use **vPvB** - (very) Persistent, (very) Bioaccumulative
WoE - Weight of Evidence

The Expert Panel for Fragrance Safety* concludes that this material is safe under the limits described in this safety assessment.

This safety assessment is based on the RIFM Criteria Document (Api et al., 2015), which should be referred to for clarifications.

Each endpoint discussed in this safety assessment includes the relevant data that were available at the time of writing (version number in the top box is indicative of the date of approval based on a 2-digit month/day/year), both in the RIFM database (consisting of publicly available and proprietary data) and through publicly available information sources (e.g., SciFinder and PubMed). Studies selected for this safety assessment were based on appropriate test criteria, such as acceptable guidelines, sample size, study duration, route of exposure, relevant animal species, most relevant testing endpoints, etc. A key study for each endpoint was selected based on the most conservative endpoint value (e.g., PNEC, NOAEL, LOEL, and NESIL).

*The Expert Panel for Fragrance Safety is an independent body that selects its own members and establishes its own operating procedures. The Expert Panel is comprised of internationally known scientists that provide RIFM with guidance relevant to human health and environmental protection.

Summary: The use of this material under current conditions is supported by existing information.

2-Methylheptanoic acid was evaluated for genotoxicity, repeated dose toxicity, developmental and reproductive toxicity, local respiratory toxicity, phototoxicity/photoallergenicity, skin sensitization, and environmental safety. Data from read-across analog isovaleric acid (CAS# 503-74-2) show that 2-methylheptanoic acid is not expected to be genotoxic. The skin sensitization endpoint was completed using the DST for non-reactive materials (900 μg/cm^2/day); exposure is below the DST. Data from read-across analog 2-ethylbutyric acid (CAS# 88-09-5) provide a calculated MOE > 100 for the repeated dose and reproductive endpoints. The local respiratory toxicity endpoint was evaluated using the TTC for a Cramer Class I material, and exposure to 2-methylheptanoic acid is below the TTC (1.4 mg/day). The phototoxicity/photoallergenicity endpoint was completed based on UV spectra; 2-methylheptanoic acid is not expected to be phototoxic/photoallergenic. The environmental endpoints were evaluated; 2-methylheptanoic acid was found not to be PBT as per the IFRA Environmental Standards, and its risk quotients, based on its current volume of use in Europe and North America (i.e., PEC/PNEC), are < 1.

Human Health Safety Assessment

Genotoxicity: Not expected to be genotoxic. (RIFM, 1999; RIFM, 2014)
Repeated Dose Toxicity: 3 mg/kg/day. (OECD, 2006)
Reproductive Toxicity: Developmental Toxicity: 50 mg/kg/day. **Fertility:** 250 mg/kg/day. (OECD, 2006)
Skin Sensitization: No safety concerns at current, declared use levels; Exposure is below the DST.
Phototoxicity/Photoallergenicity: Not phototoxic/photoallergenic. (UV Spectra, RIFM DB)
Local Respiratory Toxicity: No NOAEC available. Exposure is below the TTC.

Environmental Safety Assessment

Hazard Assessment:

Persistence: Screening-level: 3.54 (BIOWIN 3) (EPI Suite v4.11; US EPA, 2012a)
Bioaccumulation: Screening-level: 3.1 L/kg (EPI Suite v.411; US EPA, 2012a)
Ecotoxicity: Screening-level: Not applicable
Conclusion: Not PBT or vPvB as per IFRA Environmental Standards

- **Risk Assessment:** PEC/PNEC (North America and Europe): Not applicable; No volume of use reported for Europe or North America

1. Identification

1 **Chemical Name:** 2-Methylheptanoic acid
2 **CAS Registry Number:** 1188-02-9
3 **Synonyms:** Heptanoic acid, 2-methyl-; Methylamylacetic acid; 2-Methyloenanthic acid; 2-Methylheptanoic acid
4 **Molecular Formula:** $C_8H_{16}O_2$
5 **Molecular Weight:** 144.21
6 **RIFM Number:** 6698
7. **Stereochemistry:** Isomer not specified. One stereocenter and 2 total stereoisomers possible.

2. Physical data

1 **Boiling Point:** 220 °C (FMA), 234.2 °C (US ECHA, 2012a)
2 **Flash Point:** > 230.00 °F TCC (> 110.00 °C)*
3 **Log K_{OW}:** 2.96 (US ECHA, 2012a)
4 **Melting Point**: 15 °C (FMA), 37.72 °C (US ECHA, 2012a)
5 **Water Solubility:** 592.1 mg/L (US ECHA, 2012a)
6 **Specific Gravity:** 0.90600 @ 25.00 °C*
7 **Vapor Pressure:** 0.0267 mm Hg @ 20 °C (US ECHA, 2012a), 0.0458 mm Hg @ 25 °C (US ECHA, 2012a)
8 **UV Spectra:** No significant absorbance between 290 and 700 nm; molar absorption coefficient is below the benchmark (1000 L mol^{-1} · cm^{-1})
9 **Appearance/Organoleptic:** Colorless oily liquid, solidifying in the cold to a white or colorless crystalline leavy scaly mass of translucent crystals. Fatty oily, unpleasant sour odor but not sweat-like, rancid. Sour fruity, nutty taste (Arctander #2040, Volume II, 1969).

*http://www.thegoodscentscompany.com/data/rw1029221.html.

3. Exposure

1 **Volume of Use (Worldwide Band):** < 0.1 metric tons per year (IFRA, 2015)
2 **95th Percentile Concentration in Toothpaste:** 0.012% (RIFM, 2017) (no reported use in hydroalcoholics)
3 **Inhalation Exposure*:** 0.000060 mg/kg/day or 0.0046 mg/day (RIFM, 2017)
4 **Total Systemic Exposure**:** 0.00023 mg/kg/day (RIFM, 2017)

*95th percentile calculated exposure derived from concentration survey data in the Creme RIFM aggregate exposure model (Comiskey et al., 2015; Safford et al., 2015; Safford et al., 2017; and Comiskey et al., 2017).

**95th percentile calculated exposure; assumes 100% absorption unless modified by dermal absorption data as reported in Section IV. It is derived from concentration survey data in the Creme RIFM aggregate exposure model and includes exposure via dermal, oral, and inhalation routes whenever the fragrance ingredient is used in products that include these routes of exposure (Comiskey et al., 2015; Safford et al., 2015; Safford et al., 2017; and Comiskey et al., 2017).

4. Derivation of systemic absorption

1 **Dermal:** Assumed 100%
2 **Oral:** Assumed 100%
3 **Inhalation:** Assumed 100%

5. Computational toxicology evaluation

1 Cramer Classification: Class I, Low

Expert Judgment	Toxtree v 2.6	OECD QSAR Toolbox v 3.2
I	I	I

2 Analogs Selected:
a **Genotoxicity:** Isovaleric acid (CAS # 503-74-2)
b **Repeated Dose Toxicity:** 2-Ethylbutyric acid (CAS # 88-09-5)
c **Reproductive Toxicity:** 2-Ethylbutyric acid (CAS # 88-09-5)
d **Skin Sensitization:** None
e **Phototoxicity/Photoallergenicity:** None
f **Local Respiratory Toxicity:** None
g **Environmental Toxicity:** None
3 Read-across Justification: See Appendix below

6. Metabolism

No relevant data available for inclusion in this safety assessment.

7. Natural occurrence (discrete chemical) or composition (NCS)

2-Methylheptanoic acid is reported to occur in the following foods*:
Lamb and Mutton.
Tea.
*VCF Volatile Compounds in Food: database/Nijssen, L.M.; Ingen-Visscher, C.A. van; Donders, J.J.H. (eds). – Version 15.1 – Zeist (The Netherlands): TNO Triskelion, 1963–2014. A continually updated database containing information on published volatile compounds that have been found in natural (processed) food products. Includes FEMA GRAS and EU-Flavis data.

8. IFRA standard

None.

9. REACH dossier

Pre-registered for 11/30/2010; no dossier available as of 03/26/2018.

10. Summary

10.1. Human health endpoint Summaries

10.1.1. Genotoxicity

Based on the current existing data, 2-methylheptanoic acid does not present a concern for genotoxicity.

10.1.1.1. Risk assessment. 2-Methylheptanoic acid was assessed in the BlueScreen assay and found positive for both cytotoxicity and genotoxicity, without metabolic activation and negative with metabolic activation (RIFM, 2013). BlueScreen is a screening assay that assesses genotoxic stress through human derived gene expression. While the BlueScreen assay on the target material showed positive results, data from additional assays on a more reactive read-across material were considered to fully assess the potential mutagenic effect on the target material. There are no studies assessing the mutagenic activity of 2-methylheptanoic acid; however, read-across can be made to isovaleric acid (CAS # 503-74-2; see Section V). The mutagenic activity of isovaleric acid has been evaluated in a bacterial reverse mutation assay conducted in compliance with GLP regulations and in accordance with OECD TG 471 using the standard plate incorporation method. *Salmonella typhimurium* strains TA98, TA100, TA1535, TA1537, and TA102 were treated with isovaleric acid in dimethyl sulfoxide (DMSO) at concentrations up to 5000 μg/plate. No increases in the mean number of revertant colonies were observed at any tested

dose in the presence or absence of S9 (RIFM, 1999). Under the conditions of the study, isovaleric acid was not mutagenic in the Ames test, and this can be extended to 2-methylheptanoic acid.

The clastogenic activity of 2-methylheptanoic acid was evaluated in an *in vitro* micronucleus test conducted in compliance with GLP regulations and in accordance with OECD TG 487. Human peripheral blood lymphocytes were treated with 2-methylheptanoic acid in DMSO at concentrations up to 1440 μg/mL in the presence and absence of metabolic activation (S9) for 4 and 24 h 2-Methylheptanoic acid did not induce binucleated cells with micronuclei when tested up to cytotoxic levels in either non-activated or S9-activated test systems (RIFM, 2014). Under the conditions of the study, 2-methylheptanoic acid was considered to be non-clastogenic in the *in vitro* micronucleus test.

Based on the data available, 2-methylheptanoic acid does not present a concern for genotoxic potential.

Additional References: None.

Literature Search and Risk Assessment Completed On: 09/25/2017.

10.1.2. Repeated dose toxicity

The margin of exposure for 2-methylheptanoic acid is adequate for the repeated dose toxicity endpoint at the current level of use.

10.1.2.1. Risk assessment. There are insufficient repeated dose toxicity data on 2-methylheptanoic acid. Read-across material 2-ethylbutyric acid (CAS # 88-09-5; see section V) has sufficient repeated dose toxicity data. In an OECD 422/GLP combined oral repeated dose and reproductive/developmental toxicity screening test, Sprague Dawley rats (13/sex/dose) were orally (via gavage) administered 2-ethylbutyric acid at doses of 0 (vehicle control, corn oil), 10, 50, and 250 mg/kg/day for 42 days (14 days before mating, 14 days during the mating period, and 14 days after the mating period) for males and for 41–53 days (14 days before mating, throughout the mating and gestation periods, and up to day 4 of lactation) for females. Hematological examination in males revealed statistically significant reductions in white blood cell counts (mid- and high-dose) and platelet counts (high-dose). There were no treatment-related effects on hematological parameters examined in female animals. Blood biochemistry analysis showed statistically significant increased γ-GT activity in females of the mid- and high-dose groups. However, the extent of this increase was minor, and no treatment-related effects were observed in liver weights and histopathology. Hence, this effect was not considered to be of toxicological significance. Kidney weights of males (relative weight) and females (absolute and relative weights) of the high-dose group were statistically significantly increased. However, there were no correlated adverse effects observed in blood biochemistry parameters for kidney function or in histopathology; hence, the cause of this effect was unknown. No alterations were observed in gross pathology and histopathology of treatment groups when compared to the controls. Based on the statistically significant decrease in white blood cell counts in mid- and high-dose group males, a NOAEL of 10 mg/kg/day was considered for males. Based on increases in the absolute and relative kidney weights in high-dose group females, a NOAEL of 50 mg/kg/day was considered for females (JECDB Study report, 2001; also available at JECDB Study abstract, 2001 and OECD SIDS Initial Assessment Report for SIAM 23, 2006 [OECD, 2006]).

In a 90-day dietary repeated dose toxicity study, male Sprague Dawley rats (6/dose) were fed diet (30% dextrose, 20% cornmeal, 20% soybean meal, 10% casein, 9% corn starch, 5% corn oil, 4% salt mixture, 2% mixture of vitamins) containing 2-ethylbutyric acid at concentrations of 0 (control) and 0.6% (equivalent to 300 mg/kg/day, as per the EFSA report). No statistically significant treatment-related alterations were reported in parameters observed in the study. Therefore, the NOAEL was considered to be 0.6% (equivalent to 300 mg/kg/day, as per EFSA report), based on no adverse effects observed in the single tested dose group. (Amoore et al., 1978; EFSA, 2008).

The most conservative NOAEL of 10 mg/kg/day from the OECD 422 study was considered for the risk assessment.

A default safety factor of 3 was used when deriving a NOAEL from an OECD 422 study. The safety factor has been approved by the Expert Panel for Fragrance Safety*.

Thus, the derived NOAEL for the repeated dose toxicity endpoint is 10/3 or 3 mg/kg/day.

Therefore, the 2-methylheptanoic acid MOE for the repeated dose toxicity endpoint can be calculated by dividing the 2-ethylbutyric acid NOAEL in mg/kg/day by the total systemic exposure to 2-methylheptanoic acid, 3/0.00023 or 13043.

In addition, the total systemic exposure to 2-methylheptanoic acid (0.23 μg/kg bw/day) is below the TTC (30 μg/kg bw/day; Kroes et al., 2007) for the repeated dose toxicity endpoint of a Cramer Class I material at the current level of use.

*The Expert Panel for Fragrance Safety is composed of scientific and technical experts in their respective fields. This group provides advice and guidance.

Additional References: None.

Literature Search and Risk Assessment Completed On: 10/04/2017.

10.1.3. Reproductive toxicity

The margin of exposure for 2-methylheptanoic acid is adequate for the reproductive toxicity endpoint at the current level of use.

10.1.3.1. Risk assessment. There are insufficient reproductive toxicity data on 2-methylheptanoic acid. Read-across material 2-ethylbutyric acid (CAS # 88-09-5; see section V) has sufficient reproductive toxicity data. In an OECD 422/GLP combined oral repeated dose and reproductive/developmental toxicity screening test, Sprague Dawley rats (13/sex/dose) were orally (via gavage) administered 2-ethylbutyric acid at doses of 0 (vehicle control, corn oil), 10, 50, and 250 mg/kg/day for 42 days (14 days before mating, 14 days during the mating period, and 14 days after the end of the mating period) for males and for 41–53 days (14 days before mating, throughout the mating and gestation periods, and up to day 4 of lactation) for females. There were no treatment-related effects observed in estrous cycle, reproductive performance (precoital interval, numbers of corpora lutea, copulation index, and fertility index), gestation length, ovulation, number of implantation, and implantation index. In the mid- and high-dose treatment groups, abnormalities in behavior (e.g. to collect pups after birth), and prolonged delivery were reported; however, no dose dependency was found. Statistically significant decreases in the number of live newborns, birth index, live birth index (day 0 of lactation), and number of live pups (day 4 of lactation) were reported in the high-dose group. No treatment related effects were reported for pup viability (day 4 of lactation) and body weights of pups (both at days 0 and 4 of lactation). Furthermore, no treatment-related morphological alterations (external and visceral) were observed. Therefore, the fertility NOAEL was considered to be 250 mg/kg/day, the highest dose tested. The NOAEL for developmental toxicity was considered to be 50 mg/kg/day, based on a reduction in the number of live pups at the highest dose group (JECDB Study report, 2001; also available at JECDB Study abstract, 2001 and OECD SIDS Initial Assessment Profile for SIAM 23, 2006 [OECD, 2006]).

Therefore, the 2-methylheptanoic acid MOE for the developmental toxicity endpoint can be calculated by dividing the 2-ethylbutyric acid NOAEL in mg/kg/day by the total systemic exposure to 2-methylheptanoic acid, 50/0.00023 or 217391.

The 2-methylheptanoic acid MOE for the fertility endpoint can be calculated by dividing the 2-ethylbutyric acid NOAEL in mg/kg/day by the total systemic exposure to 2-methylheptanoic acid, 250/0.00023 or 1086957.

In addition, the total systemic exposure to 2-methylheptanoic acid (0.23 μg/kg bw/day) is below the TTC (30 μg/kg bw/day; Kroes et al.,

2007; Laufersweiler et al., 2012) for the reproductive toxicity endpoint of a Cramer Class I material at the current level of use.

Additional References: Narotsky et al., 1994.

Literature Search and Risk Assessment Completed On: 10/04/2017.

10.1.4. Skin sensitization

Based on the application of DST, 2-methylheptanoic acid does not present a safety concern for skin sensitization under the current, declared levels of use.

10.1.4.1. Risk assessment. The chemical structure of this material indicates that it would not be expected to react with skin proteins (Toxtree 2.6.13; OECD toolbox v3.4). No skin sensitization studies are available for 2-methylheptanoic acid or read-across materials.

Acting conservatively, due to the insufficient data, the reported exposure was benchmarked utilizing the non-reactive DST of 900 μg/cm^2. The current exposure from the 95th percentile concentration is below the DST for non-reactive materials when evaluated in all QRA categories. Table 1 provides the acceptable concentrations for 2-methylheptanoic acid, which presents no appreciable risk for skin sensitization based on the non-reactive DST.

Additional References: None.

Literature Search and Risk Assessment Completed On: 09/27/17.

10.1.5. Phototoxicity/photoallergenicity

Based on the available UV/Vis spectra, 2-methylheptanoic acid would not be expected to present a concern for phototoxicity or photoallergenicity.

10.1.5.1. Risk assessment. There are no phototoxicity studies available for 2-methylheptanoic acid in experimental models. UV/Vis absorption spectra indicate no significant absorption between 290 and 700 nm. The corresponding molar absorption coefficient is well below the benchmark of concern for phototoxicity and photoallergenicity (Henry et al., 2009). Based on lack of absorbance, 2-methylheptanoic acid does not present a concern for phototoxicity or photoallergenicity.

10.1.5.2. UV spectra analysis. UV/Vis absorption spectra (OECD TG 101) were obtained. The spectra indicate no significant absorbance in the range of 290–700 nm. The molar absorption coefficient is below the benchmark of concern for phototoxic effects, 1000 L mol^{-1} · cm^{-1} (Henry et al., 2009).

Additional References: None.

Literature Search and Risk Assessment Completed On: 09/19/17.

10.1.6. Local Respiratory Toxicity

The margin of exposure could not be calculated due to lack of appropriate data. The exposure level for 2-methylheptanoic acid is below the Cramer Class I TTC value for inhalation exposure local effects.

10.1.6.1. Risk assessment. There are no inhalation data available on 2-methylheptanoic acid. Based on the Creme RIFM Model, the inhalation exposure is 0.0046 mg/day. This exposure is 304 times lower than the Cramer Class I TTC value of 1.4 mg/day (based on human lung weight of 650 g; Carthew et al., 2009); therefore, the exposure at the current level of use is deemed safe.

Additional References:None.

Literature Search and Risk Assessment Completed On: 10/05/17.

10.2. 2. Environmental endpoint summary

10.2.1. Screening-level assessment

A screening-level risk assessment of 2-methylheptanoic acid was performed following the RIFM Environmental Framework (Salvito et al., 2002), which provides 3 tiered levels of screening for aquatic risk. In Tier 1, only the material's regional VoU, its log K_{OW}, and its molecular weight are needed to estimate a conservative risk quotient (RQ), expressed as the ratio Predicted Environmental Concentration/Predicted No Effect Concentration (PEC/PNEC). A general QSAR with a high uncertainty factor applied is used to predict fish toxicity, as discussed in Salvito et al. (2002). In Tier 2, the RQ is refined by applying a lower uncertainty factor to the PNEC using the ECOSAR model (US EPA, 2012b), which provides chemical class–specific ecotoxicity estimates. Finally, if necessary, Tier 3 is conducted using measured biodegradation and ecotoxicity data to refine the RQ, thus allowing for lower PNEC uncertainty factors. The data for calculating the PEC and PNEC for this safety assessment are provided in the table below. For the PEC, the range from the most recent IFRA Volume of Use Survey is reviewed. The PEC is then calculated using the actual regional tonnage, not the extremes of the range. Following the RIFM Environmental Framework, 2-methylheptanoic acid was not able to be risk screened as there were no reported volumes of use for either North America or

Table 1
Acceptable concentration limits for 2-methylheptanoic acid based on non-reactive DST.

IFRA Category[a]	Description of Product Type	Acceptable Concentrations in Finished Products	Reported 95th Percentile Use Concentrations in Finished Products
1	Products applied to the lips	0.07%	0.00%
2	Products applied to the axillae	0.02%	0.00%
3	Products applied to the face using fingertips	0.41%	0.00%
4	Fine fragrance products	0.39%	0.00%
5	Products applied to the face and body using the hands (palms), primarily leave-on	0.10%	0.00%
6	Products with oral and lip exposure	0.23%	0.01%
7	Products applied to the hair with some hand contact	0.79%	0.00%
8	Products with significant ano-genital exposure	0.04%	No Data
9	Products with body and hand exposure, primarily rinse-off	0.75%	0.00%
10	Household care products with mostly hand contact	2.70%	0.17%
11	Products with intended skin contact but minimal transfer of fragrance to skin from inert substrate	1.50%	No Data
12	Products not intended for direct skin contact, minimal or insignificant transfer to skin	Not Restricted	0.00%

Note.
[a] For a description of the categories, refer to the IFRA/RIFM Information Booklet.

Europe in the 2015 IFRA Survey.

A screening-level hazard assessment using EPI Suite v4.11 (US EPA, 2012a) did not identify 2-methylheptanoic acid as possibly persistent or bioaccumulative based on its structure and physical–chemical properties. This screening-level hazard assessment considers the potential for a material to be persistent *and* bioaccumulative *and* toxic, or very persistent *and* very bioaccumulative as defined in the Criteria Document (Api et al., 2015). As noted in the Criteria Document, the screening criteria applied are the same as those used in the EU for REACH (ECHA, 2012). For persistence, if the EPI Suite model BIOWIN 3 predicts a value < 2.2 and either BIOWIN 2 or BIOWIN 6 predicts a value < 0.5, then the material is considered potentially persistent. A material would be considered potentially bioaccumulative if the EPI Suite model BCFBAF predicts a fish BCF ≥ 2000 L/kg. Ecotoxicity is determined in the above screening-level risk assessment. If, based on these model outputs (Step 1), additional assessment is required, a WoE-based review is then performed (Step 2). This review considers available data on the material's physical–chemical properties, environmental fate (e.g., OECD Guideline biodegradation studies or die-away studies), fish bioaccumulation, and higher-tier model outputs (e.g., US EPA's BIOWIN and BCFBAF found in EPI Suite v4.11). Data on persistence and bioaccumulation are reported below and summarized in the Environmental Safety Assessment section prior to Section 1.

Supplementary data related to this article can be found at https://doi.org/10.1016/j.fct.2018.08.051.

Appendix. Read-across Justification

Methods

The read-across analogs were identified following the strategy for structuring and reporting a read-across prediction of toxicity described in Schultz et al. (2015). The strategy is also consistent with the guidance provided by OECD within Integrated Approaches for Testing and Assessment (OECD, 2015) and the European Chemical Agency read-across assessment framework (ECHA, 2016).

- First, materials were clustered based on their structural similarity. Second, data availability and data quality on the selected cluster was examined. Third, appropriate read-across analogs from the cluster were confirmed by expert judgment.
- Tanimoto structure similarity scores were calculated using FCFC4 fingerprints (Rogers and Hahn, 2010).
- The physical–chemical properties of the target substance and the read-across analogs were calculated using EPI Suite v4.11 (US EPA, 2012a).
- J_{max} values were calculated using RIFM's skin absorption model (SAM). The parameters were calculated using the consensus model (Shen et al., 2014).
- DNA binding, mutagenicity, genotoxicity alerts, and oncologic classification predictions were generated using OECD QSAR Toolbox v3.4 (OECD, 2012).
- ER binding and repeat dose categorization were generated using OECD QSAR Toolbox v3.4 (OECD, 2012).
- Developmental toxicity was predicted using CAESAR v2.1.7 (Cassano et al., 2010), and skin sensitization was predicted using Toxtree 2.6.13.
- Protein binding was predicted using OECD QSAR Toolbox v3.4 (OECD, 2012).
- The major metabolites for the target and read-across analogs were determined and evaluated using OECD QSAR Toolbox v3.4 (OECD, 2012).

	Target Material	Read-across Material	Read-across Material
Principal Name	2-Methylheptanoic acid	Isovaleric acid	2-Ethylbutyric acid
CAS No.	1188-02-9	503-74-2	88-09-5
Structure			Similarity (Tanimoto Score)		0.62	0.74
Read-across Endpoint		• Genotoxicity	• Repeated dose • Reproductive toxicity
Molecular Formula	$C_8H_{16}O_2$	$C_5H_{10}O_2$	$C_6H_{12}O_2$
Molecular Weight	144.22	102.13	116.16
Melting Point (°C, EPI Suite)	37.72	3.61	15.24
Boiling Point (°C, EPI Suite)	234.20	175.25	195.80
Vapor Pressure (Pa @ 25 °C, EPI Suite)	6.1	152	64.8
Log Kow(KOWWIN v1.68 in EPI Suite)	2.96	1.16	1.68
Water Solubility (mg/L, @ 25 °C, WSKOW v1.42 in EPI Suite)	592.1	40700	18000
J_{max} (mg/cm^2/h, SAM)	268.894	785.313	555.023
Henry's Law (Pa·m^3/mol, Bond Method, EPI Suite)	3.04E-001	1.30E-001	1.72E-001
Genotoxicity			
DNA Binding (OASIS v1.4, QSAR Toolbox v3.4)	• No alert found	•No alert found	
DNA Binding (OECD QSAR Toolbox v3.4)	•No alert found	•No alert found	
Carcinogenicity (ISS)	•Carcinogen (low reliability)	•Non-carcinogen (low reliability)	
DNA Binding (Ames, MN, CA, OASIS v1.1)	•No alert found	•No alert found	
In Vitro Mutagenicity (Ames, ISS)	•No alert found	•No alert found

Summary

There are insufficient toxicity data on 2-methylheptanoic acid (CAS # 1188-02-9). Hence, *in silico* evaluation was conducted to determine read-across analogs for this material. Based on structural similarity, reactivity, metabolism, physical–chemical properties, and expert judgment, isovaleric acid (CAS # 503-74-2) and 2-ethylbutyric acid (CAS # 88-09-5) were identified as read-across materials with sufficient data for toxicological evaluation.

Conclusions

- Isovaleric acid (CAS # 503-74-2) was used as a read-across analog for the target material 2-methylheptanoic acid (CAS # 1188-02-9) for the genotoxicity endpoint.
  - o The target substance and the read-across analog are structurally similar and belong to the class of branched chain aliphatic carboxylic acids.
  - o The key difference between the target substance and the read-across analog is that the target substance is a C8 molecule and the read-across analog is a C5 molecule. This structural difference is insignificant for the genotoxicity endpoint.
  - o Similarity between the target substance and the read-across analog is indicated by the Tanimoto score. The Tanimoto score is mainly driven by the carboxylic acid moiety. Differences between the structures that affect the Tanimoto score are toxicologically insignificant.
  - o The physical–chemical properties of the target substance and the read-across analog are sufficiently similar to enable comparison of their toxicological properties.
  - o According to the OECD QSAR Toolbox v3.4, structural alerts for toxicological endpoints are consistent between the target substance and the read-across analog.
  - o The target is predicted to be a nongenotoxic carcinogen by the ISS model while the read-across analog does not have such an alert. According to the ISS model within OECD QSAR Toolbox, this structural alert is due to branching at the alpha carbon of carboxylic acids or esters. Substances

belonging to this class are potentially reactive peroxisome proliferators (PPs) via peroxisome proliferator-activated receptor alpha (PPAR a) with a tumor forming mechanism that is not yet fully understood. The detailed explanation can be found within ISS models. The target molecule is an acid. Also, the molecule is predicted to be a nongenotoxic carcinogen with low reliability. All the other genotoxicity alerts are negative. Therefore, the alert can be ignored. Data for the read-across analog superseded predictions in this case.
  - o The target substance and the read-across analog are expected to be metabolized similarly, as shown by the metabolism simulator.
  - o The structural alerts for the endpoints evaluated are consistent between the metabolites of the read-across analog and the target material.
- 2-Ethylbutyric acid (CAS # 88-09-5) was used as a read-across analog for the target material 2-methylheptanoic acid (CAS # 1188-02-9) for the repeated dose and reproductive toxicity endpoints.
  - o The target substance and the read-across analog are structurally similar and belong to the class of branched chain aliphatic carboxylic acids.
  - o The target substance and the read-across analog share a carboxylic acid moiety with a saturated branched alkyl group.
  - o The key difference between the target substance and the read-across analog is that the target substance is a C8 molecule and the read-across analog is a C6 molecule. This structural difference is insignificant for the reproductive toxicity endpoint.
  - o Similarity between the target substance and the read-across analog is indicated by the Tanimoto score. The Tanimoto score is mainly driven by the carboxylic acid moiety. Differences between the structures that affect the Tanimoto score are toxicologically insignificant.
  - o The physical–chemical properties of the target substance and the read-across analog are sufficiently similar to enable comparison of their toxicological properties.
  - o According to the OECD QSAR Toolbox v3.4, structural alerts for toxicological endpoints are consistent between the target substance and the read-across analog.
  - o The read-across analog and the target substance are categorized as carboxylic acid substances with a hepatotoxicity alert for repeated dose toxicity by the HESS categorization scheme. It has been shown by numerus literature that carboxylic acids are excreted out from the human body relatively quickly with no toxic effects. The data described in the repeated dose section above show that the margin of exposure of the read-across analog is adequate at the current level of use. Therefore, the alert will be superseded by availability of the data.
  - o The read-across analog is predicted to be a toxicant by the CAESAR model for developmental toxicity while the target substance is predicted to be a non-toxicant. The data described in the developmental toxicity section above show that the read-across analog has an adequate margin of exposure at the current level of use. Therefore, the alert will be superseded by the availability of the data.
  - o The target substance and the read-across analog are expected to be metabolized similarly, as shown by the metabolism simulator.
  - o The structural alerts for the endpoints evaluated are consistent between the metabolites of the read-across analog and the target material.
