Version: 052022. Initial publication. All fragrance materials are evaluated on a fiveyear rotating basis. Revised safety assessments are published if new relevant data become available. Open access to all RIFM Fragrance Ingredient Safety Assessments is here: fragr ancematerialsafetyresource, elsevier, com,

# Abbreviation/Definition List:

2-Box Model - A RIFM, Inc. proprietary in silico tool used to calculate fragrance air exposure concentration

AF - Assessment Factor

BCF - Bioconcentration Factor

CNIH - Confirmation of No Induction in Humans test. A human repeat insult patch test that is performed to confirm an already determined safe use level for fragrance ingredients (Na et al., 2021)

Creme RIFM Model - The Creme RIFM Model uses probabilistic (Monte Carlo) simulations to allow full distributions of data sets, providing a more realistic estimate of aggregate exposure to individuals across a population (Comiskey et al., 2015, 2017; Safford et al., 2015a, 2017) compared to a deterministic aggregate approach

DEREK - Derek Nexus is an in silico tool used to identify structural alerts

DRF - Dose Range Finding

DST - Dermal Sensitization Threshold

ECHA - European Chemicals Agency

ECOSAR - Ecological Structure-Activity Relationships Predictive Model

EU - Europe/European Union

GLP - Good Laboratory Practice

IFRA - The International Fragrance Association

LOEL - Lowest Observed Effect Level

MOE - Margin of Exposure

MPPD - Multiple-Path Particle Dosimetry. An in silico model for inhaled vapors used to simulate fragrance lung deposition

NA - North America

NESIL - No Expected Sensitization Induction Level

NOAEC - No Observed Adverse Effect Concentration

NOAEL - No Observed Adverse Effect Level

NOEC - No Observed Effect Concentration

NOEL - No Observed Effect Level

OECD - Organisation for Economic Co-operation and Development

OECD TG - Organisation for Economic Co-operation and Development Testing

PBT - Persistent, Bioaccumulative, and Toxic

PEC/PNEC - Predicted Environmental Concentration/Predicted No Effect Concentration

Perfumery - In this safety assessment, perfumery refers to fragrances made by a perfumer used in consumer products only. The exposures reported in the safety assessment include consumer product use but do not include occupational exposures.

**ORA** - Quantitative Risk Assessment

QSAR - Quantitative Structure-Activity Relationship

REACH - Registration, Evaluation, Authorisation, and Restriction of Chemicals RfD - Reference Dose

RIFM - Research Institute for Fragrance Materials

Statistically Significant - Statistically significant difference in reported results as compared to controls with a  $p < 0.05\ using appropriate statistical test$ 

TTC - Threshold of Toxicological Concern

UV/Vis spectra - Ultraviolet/Visible spectra

VCF - Volatile Compounds in Food

VoU - Volume of Use

vPvB - (very) Persistent, (very) Bioaccumulative

WoE - Weight of Evidence

### The Expert Panel for Fragrance Safety\* concludes that this material is safe as described in this safety assessment.

This safety assessment is based on the RIFM Criteria Document (Api et al., 2015), which should be referred to for clarifications.

Each endpoint discussed in this safety assessment includes the relevant data that were available at the time of writing (version number in the top box is indicative of the date of approval based on a 2-digit month/day/year), both in the RIFM Database (consisting of publicly available and proprietary data) and through publicly available information sources (e.g., SciFinder and PubMed). Studies selected for this safety assessment were based on appropriate test criteria, such as acceptable guidelines, sample size, study duration, route of exposure, relevant animal species,

(continued on next column)

#### (continued)

most relevant testing endpoints, etc. A key study for each endpoint was selected based on the most conservative endpoint value (e.g., PNEC, NOAEL, LOEL, and

\*The Expert Panel for Fragrance Safety is an independent body that selects its own members and establishes its own operating procedures. The Expert Panel is comprised of internationally known scientists that provide RIFM with guidance relevant to human health and environmental protection.

# Summary: The existing information supports the use of this material as described in this safety assessment.

2-Methyl-5-(methylthio)furan was evaluated for genotoxicity, repeated dose toxicity, reproductive toxicity, local respiratory toxicity, photoirritation/ photoallergenicity, skin sensitization, and environmental safety. Data show that 2methyl-5-(methylthio)furan is not genotoxic. The repeated dose, reproductive, and local respiratory toxicity endpoints were evaluated using the Threshold of Toxicological Concern (TTC) for a Cramer Class III material, and the exposure to 2methyl-5-(methylthio)<br/>furan is below the TTC (0.0015 mg/kg/day, 0.0015 mg/kg/  $\,$ day, and 0.47 mg/day, respectively). The skin sensitization endpoint was completed using the Dermal Sensitization Threshold (DST) for non-reactive materials (900 µg/ cm<sup>2</sup>); exposure is below the DST. The photoirritation/photoallergenicity endpoints were evaluated based on data and ultraviolet/visible (UV/Vis) spectra; 2-methyl-5-(methylthio)furan is not expected to be photoirritating/photoallergenic. The environmental endpoints were evaluated; 2-methyl-5-(methylthio)furan was found not to be Persistent, Bioaccumulative, and Toxic (PBT) as per the International Fragrance Association (IFRA) Environmental Standards, and its risk quotients, based on its current volume of use in Europe and North America (i.e., Predicted Environmental Concentration/Predicted No Effect Concentration [PEC/PNEC]), are <1.

### Human Health Safety Assessment

Genotoxicity: Not genotoxic. (RIFM, 2016a; RIFM, 2016b) Repeated Dose Toxicity: No NOAEL available. Exposure is below the TTC. Reproductive Toxicity: No NOAEL available. Exposure is below the TTC. Skin Sensitization: No safety concerns at current, declared use levels; exposure is

Photoirritation/Photoallergenicity: Not (UV/Vis spectra, RIFM Database; RIFM, 2018)

photoirritating/not expected to be

photoallergenic.

Local Respiratory Toxicity: No NOAEC available. Exposure is below the TTC.

### 8. Natural occurrence

2-Methyl-5-(methylthio)furan is reported to occur in the following foods by the VCF $^*$ :

Coffee.

\*VCF (Volatile Compounds in Food): Database/Nijssen, L.M.; Ingen-Visscher, C.A. van; Donders, J.J.H. (eds). – Version 15.1 – Zeist (The Netherlands): TNO Triskelion, 1963–2014. A continually updated database containing information on published volatile compounds that have been found in natural (processed) food products. Includes FEMA GRAS and EU-Flavis data.

# 9. REACH dossier

Pre-registered for 2010; no dossier as of 05/20/22.

# 10. Conclusion

The existing information supports the use of this material as described in this safety assessment.

# 11. Summary

# 11.1. Human health endpoint summaries

# 11.1.1. Genotoxicity

Based on the current existing data, 2-methyl-5-(methylthio)furan does not present a concern for genotoxicity.

11.1.1.1. Risk assessment. 2-Methyl-5-(methylthio)furan was assessed in the BlueScreen assay and found negative for both cytotoxicity (positive: <80% relative cell density) and genotoxicity, with and without metabolic activation (RIFM, 2014). BlueScreen is a human cell-based assay for measuring the genotoxicity and cytotoxicity of chemical compounds and mixtures. Additional assays were considered to fully assess the potential mutagenic or clastogenic effects of the target material

The mutagenic activity of 2-methyl-5-(methylthio)furan has been evaluated in a bacterial reverse mutation assay conducted in compliance with GLP regulations and in accordance with OECD TG 471 using the standard plate incorporation method. Salmonella typhimurium strains TA98, TA100, TA1535, TA1537, and Escherichia coli strain WP2uvrA were treated with 2-methyl-5-(methylthio)furan in dimethyl sulfoxide (DMSO) at concentrations up to 5000  $\mu g/plate$ . No increases in the mean number of revertant colonies were observed at any tested concentration in the presence or absence of S9 (RIFM, 2016a). Under the conditions of the study, 2-methyl-5-(methylthio)furan was not mutagenic in the Ames test.

The clastogenic activity of 2-methyl-5-(methylthio)furan was evaluated in an *in vitro* micronucleus test conducted in compliance with GLP regulations and in accordance with OECD TG 487. Human peripheral blood lymphocytes were treated with 2-methyl-5-(methylthio)furan in

DMSO at concentrations up to  $5000~\mu M$  in the dose range finding (DRF) study. Micronuclei analysis was conducted at  $3333~\mu M$  in the presence and absence of metabolic activation (S9) for 3 h and in the absence of metabolic activation for 24 h 2-Methyl-5-(methylthio)furan did not induce binucleated cells with micronuclei when tested up to cytotoxic levels in either the presence or absence of an S9 activation system (RIFM, 2016b). Under the conditions of the study, 2-methyl-5-(methylthio)furan was considered to be non-clastogenic in the *in vitro* micronucleus test.

Based on the data available, 2-methyl-5-(methylthio)furan does not present a concern for genotoxic potential.

Additional References: None.

Literature Search and Risk Assessment Completed On: 11/24/21.

# 11.1.2. Repeated dose toxicity

There are no repeated dose toxicity data on 2-methyl-5-(methylthio) furan or any read-across materials. The total systemic exposure to 2-methyl-5-(methylthio)furan is below the TTC for the repeated dose toxicity endpoint of a Cramer Class III material at the current level of

11.1.2.1. Risk assessment. There are no repeated dose toxicity data on 2-methyl-5-(methylthio)furan or on any read-across materials that can

<sup>5</sup>Studies conducted according to OECD TG 406 are included in the table.

<sup>6</sup>Studies conducted according to OECD TG 442, Cottrez et al. (2016), or Forreryd et al. (2016) are included in the table.

be used to support the repeated dose toxicity endpoint. The total systemic exposure to 2-methyl-5-(methylthio)furan (0.1  $\mu$ g/kg/day) is below the TTC (1.5  $\mu$ g/kg/day; Kroes et al., 2007) for the repeated dose toxicity endpoint of a Cramer Class III material at the current level of use.

### Additional References: None.

Literature Search and Risk Assessment Completed On: 11/20/21.

# 11.1.3. Reproductive toxicity

There are no reproductive toxicity data on 2-methyl-5-(methylthio) furan or on any read-across materials. The total systemic exposure to 2-methyl-5-(methylthio)furan is below the TTC for the reproductive toxicity endpoint of a Cramer Class III material at the current level of use.

11.1.3.1. Risk assessment. There are no reproductive toxicity data on 2-methyl-5-(methylthio)furan or on any read-across materials that can be used to support the reproductive toxicity endpoint. The total systemic exposure to 2-methyl-5-(methylthio)furan (0.1  $\mu$ g/kg/day) is below the TTC (1.5  $\mu$ g/kg/day; Kroes et al., 2007; Laufersweiler et al., 2012) for the reproductive toxicity endpoint of a Cramer Class III material at the current level of use.

### Additional References: None.

Literature Search and Risk Assessment Completed On: 11/20/21.

# 11.1.4. Skin sensitization

Based on the application of DST, 2-methyl-5-(methylthio)furan does not present a safety concern for skin sensitization under the current, declared levels of use.

11.1.4.1. Risk assessment. Limited skin sensitization data are available for 2-methyl-5-(methylthio)furan (Table 1). The chemical structure of this material indicates that it would not be expected to react with skin proteins directly (Roberts et al., 2007; Toxtree v3.1.0; OECD Toolbox v4.2). Due to the limited data, the reported exposure was benchmarked utilizing the non-reactive DST of 900 µg/cm² (Safford, 2008; Safford et al., 2011; Roberts et al., 2015; Safford et al., 2015b). The current exposure from the 95th percentile concentration is below the DST for non-reactive materials when evaluated in all QRA categories. Table 2 provides the supported concentrations for 2-methyl-5-(methylthio)furan that present no appreciable risk for skin sensitization based on the non-reactive DST. These levels represent supported concentrations based on the DST approach. However, additional studies may show it could be used at higher levels.

# Additional References: None.

Literature Search and Risk Assessment Completed On: 11/17/21.

# 11.1.5. Photoirritation/photoallergenicity

Based on the available *in vitro* study data and the lack of absorbance under the biologically relevant neutral condition, 2-methyl-5-(methylthio)furan is not expected to present a concern for photoirritation. Based on the lack of absorbance at the biologically relevant neutral condition, 2-methyl-5-(methylthio)furan is not expected to present a concern for photoallergenicity.

11.1.5.1. Risk assessment. The spectra indicate no absorbance in the range of 290–700 nm under neutral conditions and minor absorbance under basic conditions. The molar absorption coefficients under neutral and basic conditions (0 and 354 L mol $^{-1} \bullet \text{cm}^{-1}$ , respectively) are below the benchmark of concern for photoirritating effects, 1000 L mol $^{-1} \bullet \text{cm}^{-1}$  (Henry et al., 2009). Absorbance under the acidic condition was greater, and the corresponding molar absorption coefficient (1571 L

**Table 2**Supported concentrations for [2-Methyl-5-(methylthio)furan] that present no appreciable risk for skin sensitization based on non-reactive DST.

IFRA Category <sup>a</sup>	Description of Product Type	Supported Concentrations <sup>b</sup> (%) in Finished Products Based on Non-reactive DST	Reported 95th Percentile Use Concentrations in Finished Products
1	Products applied to the lips	0.069	NRU <sup>c</sup>

Note.

mol<sup>−1</sup> • cm<sup>−1</sup>) was above the benchmark of concern. However, acidic conditions for the assay are defined as a pH of 2 or less and, thus, do not represent a biologically relevant condition. In an *in vitro* 3T3-neutral red uptake photoirritation assay, according to the prediction model presented in the OECD test guidelines, 2-methyl-5-(methylthio)furan was not predicted to have photoirritating potential (RIFM, 2018). Based on the available *in vitro* study data and the lack of absorbance at the biologically relevant neutral condition, 2-methyl-5-(methylthio)furan is not expected to present a concern for photoirritation. Based on the lack of absorbance at the biologically relevant neutral condition, 2-methyl-5-(methylthio)furan is not expected to present a concern for photoallergenicity.

11.1.5.2. *UV spectra analysis.* UV/Vis absorption spectra (OECD TG 101) were obtained. The spectra indicate no absorbance in the range of 290–700 nm under neutral conditions. The molar absorption coefficient

<sup>&</sup>lt;sup>a</sup> For a description of the categories, refer to the IFRA/RIFM Information Booklet.

<sup>&</sup>lt;sup>b</sup> These levels represent supported concentrations based on the DST. However, additional studies may show it could be used at higher levels.

<sup>&</sup>lt;sup>c</sup> No reported use.

<sup>&</sup>lt;sup>d</sup> Fragrance exposure from these products is very low. These products are not currently in the Creme RIFM Aggregate Exposure Model.

under neutral conditions (0 L mol $^{-1} \cdot$  cm $^{-1}$ ) is below the benchmark of concern for photoirritating effects, 1000 L mol $^{-1} \cdot$  cm $^{-1}$  (Henry et al., 2009). Absorbance under acidic and basic conditions was greater, and the corresponding molar absorption coefficient (1571 and 354 L mol $^{-1} \cdot$  cm $^{-1}$ , respectively) were above (acidic condition) and below (basic condition) the benchmark of concern. However, acidic and basic conditions for the assay are defined as a pH of 2 or less (acidic) or 10 or greater (basic) and, thus, do not represent biologically relevant conditions.

Additional References: None.

Literature Search and Risk Assessment Completed On: 11/22/21.

# 11.1.6. Local Respiratory Toxicity

The margin of exposure could not be calculated due to a lack of appropriate data. The exposure level for 2-Methyl-5-(methylthio)furan is below the Cramer Class III TTC value for inhalation exposure local effects.

11.1.6.1. Risk assessment. There are no inhalation data available on 2-methyl-5-(methylthio)furan. Based on the Creme RIFM Model, the inhalation exposure is < 0.0001 mg/day. This exposure is at least 4700 times lower than the Cramer Class III TTC value of 0.47 mg/day (based on human lung weight of 650 g; Carthew et al., 2009); therefore, the exposure at the current level of use is deemed safe.

Additional References: None.

Literature Search and Risk Assessment Completed On: 11/22/21.

# 11.2. Environmental endpoint summary

# 11.2.1. Screening-level assessment

A screening-level risk assessment of 2-methyl-5-(methylthio)furan was performed following the RIFM Environmental Framework (Salvito et al., 2002), which provides 3 tiered levels of screening for aquatic risk. In Tier 1, only the material's regional VoU, its log  $K_{\rm OW}$ , and its molecular weight are needed to estimate a conservative risk quotient (RQ), expressed as the ratio Predicted Environmental Concentration/Predicted No Effect Concentration (PEC/PNEC). A general QSAR with a high uncertainty factor applied is used to predict fish toxicity, as discussed in Salvito et al. (2002). In Tier 2, the RQ is refined by applying

material with no potential to present a possible risk to the aquatic environment (i.e., its screening-level PEC/PNEC <1).

A screening-level hazard assessment using EPI Suite v4.11 (US EPA, 2012a) did not identify 2-methyl-5-(methylthio)furan as possibly persistent or bioaccumulative based on its structure and physical-chemical properties. This screening-level hazard assessment considers the potential for a material to be persistent and bioaccumulative and toxic, or very persistent and very bioaccumulative as defined in the Criteria Document (Api et al., 2015). As noted in the Criteria Document, the screening criteria applied are the same as those used in the EU for REACH (ECHA, 2012). For persistence, if the EPI Suite model BIOWIN 3 predicts a value < 2.2 and either BIOWIN 2 or BIOWIN 6 predicts a value < 0.5, then the material is considered potentially persistent. A material would be considered potentially bioaccumulative if the EPI Suite model BCFBAF predicts a fish BCF >2000 L/kg. Ecotoxicity is determined in the above screening-level risk assessment. If, based on these model outputs (Step 1), additional assessment is required, a WoE-based review is then performed (Step 2). This review considers available data on the material's physical-chemical properties, environmental fate (e.g., OECD Guideline biodegradation studies or die-away studies), fish bioaccumulation, and higher-tier model outputs (e.g., US EPA's BIOWIN and BCFBAF found in EPI Suite v4.11).

### 11.2.2. Risk assessment

Based on the current Volume of Use (2019), 2-methyl-5-(methylthio) furan does not present a risk to the aquatic compartment in the screening-level assessment.

# 11.2.2.1. Key studies. Biodegradation:

No data available.

# Ecotoxicity:

No data available.

Other available data:

2-Methyl-5-(methylthio)furan has been pre-registered for REACH with no additional data at this time.

# 11.2.3. Risk assessment refinement

Ecotoxicological data and PNEC derivation (all endpoints reported in mg/L; PNECs in  $\mu g/L$ )

Endpoints used to calculate PNEC are underlined.

	LC50 (Fish)	EC50	EC50	(Algae)	AF	PNEC (µg/L)	Chemical Class
	(mg/L)	(Daphnia)	(mg/L)				
		(mg/L)					
RIFM Framework							
Screening-level (Tier	<u>63.41</u>				1000000	0.06341	
1)							
-							

a lower uncertainty factor to the PNEC using the ECOSAR model (US EPA, 2012b), which provides chemical class-specific ecotoxicity estimates. Finally, if necessary, Tier 3 is conducted using measured biodegradation and ecotoxicity data to refine the RQ, thus allowing for lower PNEC uncertainty factors. The data for calculating the PEC and PNEC for this safety assessment are provided in the table below. For the PEC, the range from the most recent IFRA Volume of Use Survey is reviewed. The PEC is then calculated using the actual regional tonnage, not the extremes of the range. Following the RIFM Environmental Framework, 2-methyl-5-(methylthio)furan was identified as a fragrance

Exposure information and PEC calculation (following RIFM Framework: Salvito et al., 2002)

Exposure	Europe (EU)	North America (NA)
Log K <sub>ow</sub> Used	2.5	2.5
Biodegradation Factor Used	0	0
Dilution Factor	3	3
Regional Volume of Use Tonnage Band	<1	<1
Risk Characterization: PEC/PNEC	<1	<1

Based on available data, the RQ for this material is < 1. No additional assessment is necessary.

The RIFM PNEC is  $0.06341~\mu g/L$ . The revised PEC/PNECs for EU and NA are not applicable. The material was cleared at the screening-level; therefore, it does not present a risk to the aquatic environment at the current reported VoU.

Literature Search and Risk Assessment Completed On: 05/19/22.
