Abbreviation/Definition List:

2-Box Model - A RIFM, Inc. proprietary *in silico* tool used to calculate fragrance air exposure concentration
AF - Assessment Factor
BCF - Bioconcentration Factor
Creme RIFM Model - The Creme RIFM Model uses probabilistic (Monte Carlo) simulations to allow full distributions of data sets, providing a more realistic estimate of aggregate exposure to individuals across a population (Comiskey et al., 2015, 2017; Safford et al., 2015a, 2017) compared to a deterministic aggregate approach
DEREK - Derek Nexus is an *in silico* tool used to identify structural alerts
DST - Dermal Sensitization Threshold
ECHA - European Chemicals Agency
EU - Europe/European Union
GLP - Good Laboratory Practice
IFRA - The International Fragrance Association
LOEL - Lowest Observable Effect Level
MOE - Margin of Exposure
MPPD - Multiple-Path Particle Dosimetry. An *in silico* model for inhaled vapors used to simulate fragrance lung deposition
NA - North America
NESIL - No Expected Sensitization Induction Level
NOAEC - No Observed Adverse Effect Concentration
NOAEL - No Observed Adverse Effect Level
NOEC - No Observed Effect Concentration
NOEL - No Observed Effect Level
OECD - Organisation for Economic Co-operation and Development
OECD TG - Organisation for Economic Co-operation and Development Testing Guidelines
PBT - Persistent, Bioaccumulative, and Toxic
PEC/PNEC - Predicted Environmental Concentration/Predicted No Effect Concentration
QRA - Quantitative Risk Assessment
REACH - Registration, Evaluation, Authorisation, and Restriction of Chemicals
RfD - Reference Dose
RIFM - Research Institute for Fragrance Materials
RQ - Risk Quotient
Statistically Significant - Statistically significant difference in reported results as compared to controls with a $p < 0.05$ using appropriate statistical test
TTC - Threshold of Toxicological Concern
UV/Vis spectra - Ultraviolet/Visible spectra
VCF - Volatile Compounds in Food
VoU - Volume of Use **vPvB** - (very) Persistent, (very) Bioaccumulative
WoE - Weight of Evidence

The Expert Panel for Fragrance Safety* concludes that this material is safe under the limits described in this safety assessment.

This safety assessment is based on the RIFM Criteria Document (Api et al., 2015), which should be referred to for clarifications. Each endpoint discussed in this safety assessment includes the relevant data that were available at the time of writing (version number in the top box is indicative of the date of approval based on a 2-digit month/day/year), both in the RIFM database (consisting of publicly available and proprietary data) and through publicly available information sources (e.g., SciFinder and PubMed). Studies selected for this safety assessment were based on appropriate test criteria, such as acceptable guidelines, sample size, study duration, route of exposure, relevant animal species, most relevant testing endpoints, etc. A key study for each endpoint was selected based on the most conservative endpoint value (e.g., PNEC, NOAEL, LOEL, and NESIL).

*The Expert Panel for Fragrance Safety is an independent body that selects its own members and establishes its own operating procedures. The Expert Panel is comprised of internationally known scientists that provide RIFM with guidance relevant to human health and environmental protection.

Summary: The use of this material under current conditions is supported by existing information.

Citronellyl phenylacetate was evaluated for genotoxicity, repeated dose toxicity, reproductive toxicity, local respiratory toxicity, phototoxicity/photoallergenicity, skin sensitization, and environmental safety. Data show that citronellyl phenylacetate is not genotoxic. The skin sensitization endpoint was completed using the DST for non-reactive materials (900 $\mu\text{g}/\text{cm}^2$); exposure is below the DST. The repeated dose, reproductive, and local respiratory toxicity endpoints were evaluated using the TTC for a Cramer Class I material and the exposure to citronellyl phenylacetate is below the TTC (0.03 mg/kg/day, 0.03 mg/kg/day, and 1.4 mg/day, respectively). The phototoxicity/photoallergenicity endpoints were evaluated based on UV spectra; citronellyl phenylacetate is not expected to be phototoxic/photoallergenic. The environmental endpoints were evaluated; citronellyl phenylacetate was found not to be PBT as per the IFRA Environmental Standards, and its risk quotients, based on its current volume of use in Europe and North America (i.e., PEC/PNEC), are < 1 .

Human Health Safety Assessment

Genotoxicity: Not genotoxic. (RIFM, 2014b; RIFM, 2014c)
Repeated Dose Toxicity: No NOAEL available. Exposure is below the TTC.
Reproductive Toxicity: No NOAEL available. Exposure is below the TTC.
Skin Sensitization: No safety concerns at current, declared use levels; Exposure is below the DST.
Phototoxicity/Photoallergenicity: Not expected to be phototoxic/photoallergenic. (UV Spectra, RIFM Database)
Local Respiratory Toxicity: No NOAEC available. Exposure is below the TTC.

Environmental Safety Assessment

Hazard Assessment:
Persistence: Screening-level: 2.7 (BIOWIN 3) (EPI Suite v4.1; US EPA, 2012a)
Bioaccumulation: Screening-level: 6353 L/kg (EPI Suite v4.1; US EPA, 2012a)
Ecotoxicity: 48-h *Daphnia magna* LC50: 0.028 mg/L (ECOSAR; US EPA, 2012b)
Conclusion: Not PBT or vPvB as per IFRA Environmental Standards

Risk Assessment:

Screening-level: PEC/PNEC (North America and Europe) > 1 (RIFM Framework; Salvito et al., 2002)
Critical Ecotoxicity Endpoint: 48-h *Daphnia magna* LC50: 0.028 mg/L (ECOSAR; US EPA, 2012a)
RIFM PNEC is: 0.0028 $\mu\text{g}/\text{L}$
 • Revised PEC/PNECs (2015 IFRA VoU): North America and Europe: < 1

1. Identification

Chemical Name: Citronellyl phenylacetate	Chemical Name: Rhodinyl phenylacetate
CAS Registry Number: 139-70-8	CAS Registry Number: 10486-14-3
Synonyms: Benzeneacetic acid, 3,7-dimethyl-6-octenyl ester; Citronellyl α -toluate; 3,7-Dimethyl-6-octen-1-yl phenylacetate; α -Toluate; α -Toluate; α -Toluate; α -Toluate; α -Toluate; Citronellyl phenylacetate	Synonyms: (S)-3,7-Dimethyloct-7-en-1-yl phenylacetate; 3,7-Dimethyloct-7-en-1-yl phenylacetate; Benzeneacetic acid, 3,7-dimethyl-7-octenyl ester, (S)-; Rhodinyl α -toluate; Rhodinyl phenylacetate; α -Toluate; α -Toluate; α -Toluate; α -Toluate; Rhodinyl phenylacetate
Molecular Formula: C ₁₈ H ₂₆ O ₂	Molecular Formula: C ₁₈ H ₂₆ O ₂
Molecular Weight: 274.41	Molecular Weight: 274.41
RIFM Number: 955	RIFM Number: 997
Stereochemistry: Isomer not specified. One stereocenter and 2 total stereoisomers possible.	Stereochemistry: Isomer not specified. One stereocenter and 2 total stereoisomers possible.

Melting Point: 62.62 °C (EPI Suite)	Melting Point: 71.4 °C (EPI Suite)
Water Solubility: 0.07646 mg/L (EPI Suite)	Water Solubility: 0.6551 mg/L (EPI Suite)
Specific Gravity: Not Available	Specific Gravity: Not Available
Vapor Pressure: 0.0000385 mm Hg @ 20 °C (EPI Suite v4.0), 7.59e-005 mm Hg @ 25 °C (EPI Suite)	Vapor Pressure: 0.0000404 mm Hg @ 20 °C (EPI Suite v4.0), 7.97e-005 mm Hg @ 25 °C (EPI Suite)
UV Spectra: Minor absorbance between 290 and 700 nm; molar absorption coefficient is below the benchmark (1000 L mol ⁻¹ cm ⁻¹)	UV Spectra: Minor absorbance between 290 and 700 nm; molar absorption coefficient is below the benchmark (1000 L mol ⁻¹ cm ⁻¹)
Appearance/Organoleptic: Colorless to very pale yellow-greenish liquid with the odor of rose absolute with honey-like undertone	Appearance/Organoleptic: Slightly yellow to slightly green liquid. Very pale straw colored, viscous liquid. Sweet and very deep soft honey-like rose fragrance with considerable resemblance to the fond of rose absolute (Arctander, 1969).

3. Exposure***

- Volume of Use (worldwide band):** < 0.1 metric tons per year (IFRA, 2015)
- 95th Percentile Concentration in Hydroalcohols:** 0.020% (RIFM, 2017)
- Inhalation Exposure*:** 0.000012 mg/kg/day or 0.00084 mg/day (RIFM, 2017)
- Total Systemic Exposure**:** 0.00071 mg/kg/day (RIFM, 2017)

*95th percentile calculated exposure derived from concentration survey data in the Creme RIFM aggregate exposure model (Comiskey et al., 2015; Safford et al., 2015a; Safford et al., 2017; and Comiskey et al., 2017).

**95th percentile calculated exposure; assumes 100% absorption unless modified by dermal absorption data as reported in Section IV. It is derived from concentration survey data in the Creme RIFM aggregate exposure model and includes exposure via dermal, oral and inhalation routes whenever the fragrance ingredient is used in products that include these routes of exposure (Comiskey et al., 2015; Safford et al.,

2015a; Safford et al., 2017 and Comiskey et al., 2017).

***When a safety assessment includes multiple materials, the highest exposure out of all included materials will be recorded here for the 95th Percentile Concentration in Hydroalcohols or 97.5th percentile, inhalation exposure and total exposure.

4. Derivation of systemic absorption

- Dermal:** Assumed 100%
- Oral:** Assumed 100%
- Inhalation:** Assumed 100%

5. Computational toxicology evaluation

- Cramer Classification:** Class I, Low

Expert Judgment	Toxtree v 2.6	OECD QSAR Toolbox v 3.2 (OECD, 2012)
I	I	I

2. Analogs Selected:

- Genotoxicity:** None
 - Repeated Dose Toxicity:** None
 - Reproductive Toxicity:** None
 - Skin Sensitization:** None
 - Phototoxicity/Photoallergenicity:** None
 - Local Respiratory Toxicity:** None
 - Environmental Toxicity:** None
- Read-across Justification:** None

6. Metabolism

Not considered for this risk assessment and therefore not reviewed except where it may pertain in specific endpoint sections as discussed below.

7. Natural occurrence (discrete chemical) or composition (NCS)

Citronellyl phenylacetate and rhodinyl phenylacetate are not reported to occur in food by the VCF*.

*VCF Volatile Compounds in Food: Database/Nijssen, L.M.; Ingen-Visscher, C.A. van; Donders, J.J.H. (eds). – Version 15.1 – Zeist (The Netherlands): TNO Triskelion, 1963–2014. A continually updated database that contains information on published volatile compounds that have been found in natural (processed) food products. Includes FEMA GRAS and EU-Flavis data.

8. IFRA standard

None.

9. Reach dossier

Both materials in this assessment are pre-registered for 2010, no dossier available as of 07/30/2018.

10. Summary

10.1. Human health endpoint summaries

10.1.1. Genotoxicity

Based on the current existing data, citronellyl phenylacetate does not present a concern for genotoxicity.

10.1.1.1. Risk assessment. Citronellyl phenylacetate was assessed in the BlueScreen assay and found negative for genotoxicity, with and without metabolic activation (RIFM, 2014a). There are no studies assessing the mutagenic activity of citronellyl phenylacetate; however, the mutagenic activity of an isomer, rhodinyl phenylacetate (CAS # 10486-14-3) has been evaluated in a bacterial reverse mutation assay conducted in compliance with GLP regulations and in accordance with OECD TG 471 (OECD, 2015) using the standard plate incorporation. *Salmonella typhimurium* strains TA98, TA100, TA1535, TA1537, and *Escherichia coli* strain WP2uvrA were treated with rhodinyl phenylacetate in dimethyl sulfoxide (DMSO) at concentrations up to 5000 µg/plate. No increases in the mean number of revertant colonies were observed at any tested dose in the presence or absence of S9 (RIFM, 2014c). Under the conditions of the study, rhodinyl phenylacetate was not mutagenic in the Ames test.

There are no studies assessing the clastogenic activity of citronellyl phenylacetate; however, the clastogenic activity of an isomer, rhodinyl phenylacetate (CAS # 10486-14-3) was evaluated in an *in vitro* micronucleus test conducted in compliance with GLP regulations and in accordance with OECD TG 487. Human peripheral blood lymphocytes were treated with rhodinyl phenylacetate in dimethyl sulfoxide (DMSO) at concentrations up to 2750 µg/mL in the presence and absence of metabolic activation (S9) for 3 and 24 h. Rhodinyl phenylacetate did not induce binucleated cells with micronuclei when tested up to the maximum dose in either non-activated or S9-activated test systems (RIFM, 2014b). Under the conditions of the study, rhodinyl phenylacetate was considered to be non-clastogenic in the *in vitro* micronucleus test.

Based on the data available, rhodinyl phenylacetate does not present a concern for genotoxic potential, and this can be extended to citronellyl phenylacetate.

Additional References: RIFM, 2013.

Literature Search and Risk Assessment Completed On: 6/28/17.

10.1.2. Repeated dose toxicity

There are insufficient repeated dose toxicity data on citronellyl phenylacetate or any read-across materials. The total systemic exposure to citronellyl phenylacetate is below the TTC for the repeated dose toxicity endpoint of a Cramer Class I material at the current level of use.

10.1.2.1. Risk assessment. There are no repeated dose toxicity data on citronellyl phenylacetate or any read-across materials that can be used to support the repeated dose toxicity endpoint. The total systemic exposure to citronellyl phenylacetate (0.71 µg/kg/day) is below the TTC (30 µg/kg bw/day; Kroes et al., 2007) for the repeated dose toxicity endpoint of a Cramer Class I material at the current level of use.

Additional References: None.

Literature Search and Risk Assessment Completed On: 11/28/17.

10.1.3. Reproductive toxicity

There are insufficient reproductive toxicity data on citronellyl phenylacetate or any read-across materials. The total systemic exposure to citronellyl phenylacetate is below the TTC for the reproductive toxicity endpoint of a Cramer Class I material at the current level of use.

10.1.3.1. Risk assessment. There are no reproductive toxicity data on citronellyl phenylacetate or any read-across materials that can be used to support the reproductive toxicity endpoint. The total systemic exposure to citronellyl phenylacetate (0.71 µg/kg bw/day) is below the TTC (30 µg/kg bw/day; Kroes et al., 2007; Laufersweiler et al., 2012) for the reproductive toxicity endpoint of a Cramer Class I material at the current level of use.

Additional References: None.

Literature Search and Risk Assessment Completed On: 11/28/17.

10.1.4. Skin sensitization

Based on the existing data and the application of DST, citronellyl phenylacetate does not present a safety concern for skin sensitization under the current, declared levels of use.

Table 1

Acceptable concentrations for citronellyl phenylacetate that present no appreciable risk for skin sensitization based on non-reactive DST.

IFRA Category ^a	Description of Product Type	Acceptable Concentrations in Finished Products Based on Non-reactive DST	Reported 95th Percentile Concentration in Finished Products
1	Products applied to the lips	0.07%	0.00% ^b
2	Products applied to the axillae	0.02%	0.00% ^b
3	Products applied to the face using fingertips	0.41%	0.00% ^b
4	Fine fragrance products	0.39%	0.02%
5	Products applied to the face and body using the hands (palms), primarily leave-on	0.10%	0.01%
6	Products with oral and lip exposure	0.23%	0.00%
7	Products applied to the hair with some hand contact	0.79%	0.00% ^b
8	Products with significant ano-genital exposure	0.04%	No Data ^c
9	Products with body and hand exposure, primarily rinse-off	0.75%	0.00% ^b
10	Household care products with mostly hand contact	2.70%	0.00%
11	Products with intended skin contact but minimal transfer of fragrance to skin from inert substrate	1.50%	No Data ^c
12	Products not intended for direct skin contact, minimal or insignificant transfer to skin	Not Restricted	0.00% ^b

Note:

^a For a description of the categories, refer to the IFRA/RIFM Information Booklet.

^b Negligible exposure (< 0.01%).

^c Fragrance exposure from these products is very low. These products are not currently in the Creme RIFM Aggregate Exposure Model.

10.1.4.1. Risk assessment. The chemical structure of this material indicates that it would not be expected to react with skin proteins (Toxtree 2.6.13; OECD toolbox v3.4). No predictive skin sensitization studies are available for citronellyl phenylacetate or read-across materials. However, in a human maximization tests, no skin sensitization reactions were observed (RIFM, 1977a; RIFM, 1977b; RIFM, 1977c). Acting conservatively, due to the limited data, the reported exposure was benchmarked utilizing the non-reactive Dermal Sensitization Threshold (DST) of 900 $\mu\text{g}/\text{cm}^2$ (Safford, 2008; Safford et al., 2011; Safford et al., 2015b; Roberts et al., 2015). The current exposure from the 95th percentile concentration is below the DST for non-reactive materials when evaluated in all QRA categories. Table 1 provides the acceptable concentrations for citronellyl phenylacetate that present no appreciable risk for skin sensitization based on the non-reactive DST. These concentrations are not limits; they represent acceptable concentrations based on the DST approach.

Additional References: None.

Literature Search and Risk Assessment Completed On: 11/20/17.

10.1.5. Phototoxicity/photoallergenicity

Based on the available UV/Vis spectra, citronellyl phenylacetate would not be expected to present a concern for phototoxicity or photoallergenicity.

10.1.5.1. Risk assessment. There are no phototoxicity studies available for citronellyl phenylacetate in experimental models. UV/Vis absorption spectra indicate minor absorption between 290 and 700 nm. The corresponding molar absorption coefficient is well below the benchmark of concern for phototoxicity and photoallergenicity (Henry et al., 2009). Based on lack of absorbance, citronellyl phenylacetate does not present a concern for phototoxicity or photoallergenicity.

10.1.5.2. UV spectra analysis. UV/Vis absorption spectra (OECD TG 101) were obtained. The spectra indicate minor absorbance in the range of 290–700 nm. The molar absorption coefficient is below the benchmark of concern for phototoxic effects, 1000 $\text{L mol}^{-1} \text{cm}^{-1}$ (Henry et al., 2009).

Additional References: None.

Literature Search and Risk Assessment Completed On: 10/19/17.

10.1.6. Local Respiratory Toxicity

The margin of exposure could not be calculated due to lack of appropriate data. The exposure level for citronellyl phenylacetate is below the Cramer Class I TTC value for inhalation exposure local effects.

10.1.6.1. Risk assessment. There are no inhalation data available on citronellyl phenylacetate. Based on the Creme RIFM Model, the inhalation exposure is 0.00084 mg/day. This exposure is 1667 times lower than the Cramer Class I TTC value of 1.4 mg/day (based on human lung weight of 650 g; Carthew et al., 2009); therefore, the exposure at the current level of use is deemed safe.

Additional References: None.

Literature Search and Risk Assessment Completed On: 12/01/2017.

10.2. Environmental endpoint summary

10.2.1. Screening-level assessment

A screening-level risk assessment of citronellyl phenylacetate was performed following the RIFM Environmental Framework (Salvito et al., 2002) which provides 3 tiered levels of screening for aquatic risk. In Tier 1, only the material's regional VoU, its log K_{OW} , and its molecular weight are needed to estimate a conservative risk quotient (RQ), expressed as the ratio Predicted Environmental Concentration/Predicted No Effect Concentration (PEC/PNEC). A general QSAR with a high uncertainty factor applied is used to predict fish toxicity, as discussed in Salvito et al. (2002). In Tier 2, the RQ is refined by applying a lower uncertainty factor to the PNEC using the ECOSAR model (US EPA, 2012b), which provides chemical class-specific ecotoxicity estimates. Finally, if necessary, Tier 3 is conducted using measured biodegradation and ecotoxicity data to refine the RQ, thus allowing for lower PNEC uncertainty factors. The data for calculating the PEC and PNEC for this safety assessment are provided in the table below. For the PEC, the range from the most recent IFRA Volume of Use Survey is reviewed. The PEC is then calculated using the actual regional tonnage, not the extremes of the range. Following the RIFM Environmental Framework, citronellyl phenylacetate was identified as a fragrance material with the potential to present a possible risk to the aquatic environment (i.e., its screening-level PEC/PNEC > 1).

A screening-level hazard assessment using EPI Suite v4.1 identified citronellyl phenylacetate as not possibly persistent but bioaccumulative based on its structure and physical-chemical properties. This screening-level hazard assessment considers the potential for a material to be persistent *and* bioaccumulative *and* toxic, or very persistent *and* very bioaccumulative as defined in the Criteria Document (Api et al., 2015). As noted in the Criteria Document, the screening criteria applied are the same as those used in the EU for REACH (ECHA, 2012). For persistence, if the EPI Suite model BIOWIN 3 predicts a value < 2.2 and either BIOWIN 2 or BIOWIN 6 predicts a value < 0.5, then the material is considered potentially persistent. A material would be considered potentially bioaccumulative if the EPI Suite model BCFBAF predicts a fish BCF ≥ 2000 L/kg. Ecotoxicity is determined in the above screening-level risk assessment. If, based on these model outputs (Step 1), additional assessment is required, a WoE-based review is then performed (Step 2). This review considers available data on the material's physical-chemical properties, environmental fate (e.g., OECD Guideline biodegradation studies or die-away studies), fish bioaccumulation, and higher-tier model outputs (e.g., US EPA's BIOWIN and BCFBAF found in EPI Suite v4.1). Data on persistence and bioaccumulation are reported below and summarized in the Environmental Safety Assessment section prior to Section 1.

10.2.2. Risk assessment

Based on the current Volume of Use (2015), citronellyl phenylacetate presents a risk to the aquatic compartment in the screening-level assessment.

Biodegradation: No data available.

Ecotoxicity: No data available.

Other available data: Citronellyl phenylacetate has been pre-registered for REACH with no additional data at this time.

10.2.3. Risk assessment refinement

Ecotoxicological data and PNEC derivation (all endpoints reported in mg/L; PNECs in $\mu\text{g}/\text{L}$).

Endpoints used to calculate PNEC are underlined.

	LC50 (Fish) (mg/L)	EC50 (Daphnia) (mg/L)	EC50 (Algae) (mg/L)	AF	PNEC (µg/L)	Chemical Class
RIFM Framework Screening-level (Tier 1)	<u>0.0671</u>			1,000,000	6.71E-05	
ECOSAR Acute Endpoints (Tier 2) Ver 1.11	0.118	0.155	0.034			Esters
ECOSAR Acute Endpoints (Tier 2) Ver 1.11	0.035	<u>0.028</u>	0.106	10,000	0.0028	Neutral Organics

Exposure information and PEC calculation (following RIFM Framework: Salvito et al., 2002).

Exposure	Europe (EU)	North America (NA)
Log K _{ow} Used	6.3	6.3
Biodegradation Factor Used	1	1
Dilution Factor	3	3
Regional Volume of Use Tonnage Band	< 1	< 1
Risk Characterization: PEC/PNEC	< 1	< 1

Based on available data, the RQ for this material is < 1. No additional assessment is necessary.

The RIFM PNEC is 0.0028 µg/L. The revised PEC/PNECs for EU and NA are < 1; therefore, the material does not present a risk to the aquatic environment at the current reported volumes of use.

Literature Search and Risk Assessment Completed On: 12/1/17.
