Name: N-Furfurylpyrrole CAS Registry Number: 1438-94-4

Abbreviation/Definition List:

2-Box Model - A RIFM, Inc. proprietary in silico tool used to calculate fragrance air exposure concentration

 ${\bf AF}$ - Assessment Factor

BCF - Bioconcentration Factor

Creme RIFM Model - The Creme RIFM Model uses probabilistic (Monte Carlo) simulations to allow full distributions of data sets, providing a more realistic estimate of aggregate exposure to individuals across a population (Comiskey et al., 2015, 2017; Safford et al., 2015a, 2017) compared to a deterministic aggregate approach
DEREK - Derek Nexus is an *in silico* tool used to identify structural alerts
DRF - Dose Range Finding

A.M. Api, et al.

- DST Dermal Sensitization Threshold ECHA - European Chemicals Agency ECOSAR - Ecological Structure-Activity Relationships Predictive Model EU - Europe/European Union GLP - Good Laboratory Practice IFRA - The International Fragrance Association LOEL - Lowest Observable Effect Level MOE - Margin of Exposure MPPD - Multiple-Path Particle Dosimetry. An in silico model for inhaled vapors used to simulate fragrance lung deposition NA - North America NESIL - No Expected Sensitization Induction Level NOAEC - No Observed Adverse Effect Concentration NOAEL - No Observed Adverse Effect Level NOEC - No Observed Effect Concentration
- NOEL No Observed Effect Level

OECD - Organisation for Economic Co-operation and Development

OECD TG - Organisation for Economic Co-operation and Development Testing Guidelines

PBT - Persistent, Bioaccumulative, and Toxic

PEC/PNEC - Predicted Environmental Concentration/Predicted No Effect Concentration Perfumery - In this safety assessment, perfumery refers to fragrances made by a perfumer used in consumer products only. The exposures reported in the safety assessment include consumer product use but do not include occupational exposures.

ORA - Ouantitative Risk Assessment

OSAR - Quantitative Structure-Activity Relationship

REACH - Registration, Evaluation, Authorisation, and Restriction of Chemicals

RfD - Reference Dose

RIFM - Research Institute for Fragrance Materials

RO - Risk Ouotient

Statistically Significant - Statistically significant difference in reported results as compared to controls with a p < 0.05 using appropriate statistical test

TTC - Threshold of Toxicological Concern

UV/Vis spectra - Ultraviolet/Visible spectra

VCF - Volatile Compounds in Food

VoU - Volume of Use

vPvB - (very) Persistent, (very) Bioaccumulative

WoE - Weight of Evidence

The Expert Panel for Fragrance Safety* concludes that this material is safe as described in this safety assessment.

This safety assessment is based on the RIFM Criteria Document (Api et al., 2015), which should be referred to for clarifications. Each endpoint discussed in this safety assessment includes the relevant data that were available at the time of writing (version number in the top box is indicative of the date of approval based on a 2-digit month/day/year), both in the RIFM Database (consisting of publicly available and proprietary data) and through publicly available information sources (e.g., SciFinder and PubMed). Studies selected for this safety assessment were based on appropriate test criteria, such as acceptable guidelines, sample size, study duration, route of exposure, relevant animal species, most relevant testing endpoints, etc. A key study for each endpoint was selected based on the most conservative endpoint value (e.g., PNEC, NOAEL, LOEL, and NESIL).

*The Expert Panel for Fragrance Safety is an independent body that selects its own members and establishes its own operating procedures. The Expert Panel is comprised of internationally known scientists that provide RIFM with guidance relevant to human health and environmental protection.

Summary: The existing information supports the use of this material as described in this safety assessment.

N-Furfurylpyrrole was evaluated for genotoxicity, repeated dose toxicity, reproductive toxicity, local respiratory toxicity, phototoxicity/photoallergenicity, skin sensitization, and environmental safety. Data show that N-furfurylpyrrole is not genotoxic. The skin sensitization endpoint was completed using the dermal sensitization threshold (DST) for nonreactive materials (900 µg/cm²); exposure is below the DST. The repeated dose, reproductive, and local respiratory toxicity endpoints were evaluated using the threshold for toxicological concern (TTC) for a Cramer Class III material, and the exposure to N-furfurylpyrrole is below the TTC (0.0015 mg/kg/day, 0.0015 mg/kg/day, and 0.47 mg/day, respectively). The phototoxicity/photoallergenicity endpoints were evaluated based on UV spectra; N-furfurylpyrrole is not expected to be phototoxic/photoallergenic. The environmental endpoints were evaluated, N-furfurylpyrrole was found not to be persistent, bioaccumulative, and toxic (PBT) as per the International Fragrance Association (IFRA) Environmental Standards, and its risk quotients, based on its current Volume of Use in Europe and North America (i.e., Predicted Environmental Concentration/Predicted No Effect Concentration [PEC/PNEC]) are <1.

(RIFM, 2017a; RIFM, 2017b)

Human Health Safety Assessment

Genotoxicity:	Not	genotoxic.

Repeated Dose Toxicity: No NOAEL available. Exposure is below the TTC. Reproductive Toxicity: No NOAEL available. Exposure is below the TTC. Skin Sensitization: No safety concerns at current, declared use levels; Exposure is below the DST. Phototoxicity/Photoallergenicity: Not expected to be phototoxic/photoallergenic. (UV Spectra, RIFM Database) Local Respiratory Toxicity: No NOAEC available. Exposure is below the TTC. Environmental Safety Assessment Hazard Assessment: Persistence: Screening-level: 2.9 (BIOWIN 3) (EPI Suite v4.11; US EPA, 2012a) (EPI Suite v4.11: US EPA, 2012a) Bioaccumulation: Screening-level: 20.84 L/kg Ecotoxicity: Screening-level: Fish LC50: 72.92 mg/L (Salvito et al., 2002) Conclusion: Not PBT or vPvB as per IFRA Environmental Standards **Risk Assessment:** Screening-level: PEC/PNEC (North America and Europe) < 1(Salvito et al., 2002) (Salvito et al., 2002)

Critical Ecotoxicity Endpoint: Fish LC50: 72.92 mg/L

RIFM PNEC is: 0.07292 µg/L

• Revised PEC/PNECs (2015 IFRA VoU): North America and Europe: not applicable; cleared at screening-level

1. Identification

- 1. Chemical Name: N-Furfurylpyrrole
- 2. CAS Registry Number: 1438-94-4
- 3. **Synonyms:** 1-(2-Furfuryl)pyrrole; 1-Furfuryl-1H-pyrrole; 1-H-Pyrrole, 1-(2-furanylmethyl)-; 1-(2-Furylmethyl)-1H-pyrrole; 1-Furfurylpyrrole; N-Furfurylpyrrole
- 4. Molecular Formula: C₉H₉NO
- 5. Molecular Weight: 147.18
- 6. RIFM Number: 5056
- 7. **Stereochemistry:** Isomer not specified. No stereocenters and no stereoisomers possible.

2. Physical data

- 1. Boiling Point: 69 °C (FMA), 224.28 °C (EPI Suite)
- 2. Flash Point: 93 °C (GHS), > 180 °F; CC (FMA)
- 3. Log K_{ow}: 2.5 (EPI Suite)
- 4. Melting Point: 31.64 °C (EPI Suite)
- 5. Water Solubility: 568 mg/L (EPI Suite)
- 6. **Specific Gravity*:** 1.07800 to 1.08400 @ 25.00 °C
- 7. **Vapor Pressure:** 0.0509 mm Hg @ 20 °C (EPI Suite v4.0), 0.2 mm Hg 20 °C (FMA), 0.0858 mm Hg @ 25 °C (EPI Suite)
- 8. UV Spectra: Minor absorbance between 290 and 700 nm; molar absorption coefficient is below the benchmark (1000 L mol⁻¹ \cdot cm⁻¹)
- 9. **Appearance/Organoleptic*:** A yellow-brown clear liquid with a medium vegetable, plastic, green, waxy, fruity, coffee, cereal, bready, radish, mushroom odor with potato nuances. The taste is described as vegetative, onion, sharp, and metallic.

3. Volume of use (worldwide band)

1. < 0.1 metric ton per year (IFRA, 2015)

4. Exposure to fragrance ingredient

- 1. 95th Percentile Concentration in Hydroalcoholics: 0.000018% (RIFM, 2016)
- 2. Inhalation Exposure*: < 0.0001 mg/kg/day or 0.0000031 mg/day (RIFM, 2016)
- 3. Total Systemic Exposure**: 0.0000005 mg/kg/day (RIFM, 2016)

*95th percentile calculated exposure derived from concentration survey data in the Creme RIFM Aggregate Exposure Model (Comiskey et al., 2015; Safford, 2015a; Safford et al., 2017; and Comiskey et al., 2017).

**95th percentile calculated exposure; assumes 100% absorption unless modified by dermal absorption data as reported in Section V. It is derived from concentration survey data in the Creme RIFM Aggregate Exposure Model and includes exposure via dermal, oral, and inhalation routes whenever the fragrance ingredient is used in products that include these routes of exposure (Comiskey et al., 2015; Safford et al., 2015a; Safford et al., 2017; and Comiskey et al., 2017).

5. Derivation of systemic absorption

- 1. Dermal: Assumed 100%
- 2. Oral: Assumed 100%
- 3. Inhalation: Assumed 100%

- 6. Computational toxicology evaluation
- 1. Cramer Classification: Class III, High

Expert Judgment	Toxtree v 2.6	OECD QSAR Toolbox v 3.2
III	III	III

- 2. Analogs Selected:
 - a. Genotoxicity: None
 - b. Repeated Dose Toxicity: None
 - c. Reproductive Toxicity: None
 - d. Skin Sensitization: None
 - e. Phototoxicity/Photoallergenicity: None
 - f. Local Respiratory Toxicity: None
 - g. Environmental Toxicity: None
- 3. Read-across Justification: None

7. Metabolism

No relevant data available for inclusion in this safety assessment. Additional References: None.

8. Natural occurrence (discrete chemical) or composition (NCS)

N-Furfurylpyrrole is reported to occur in the following foods by the VFC*:

Beer Chicken Cocoa Coffee Fiber, hazelnut (*Corylus avellano*) Malt Okra (Hibiscus esculentus L.) Peanut (*Arachis hypogaea* L) Popcorn Wheaten bread

*VCF Volatile Compounds in Food: Database/Nijssen, L.M.; Ingen-Visscher, C.A. van; Donders, J.J.H. (eds). – Version 15.1 – Zeist (The Netherlands): TNO Triskelion, 1963–2014. A continually updated database containing information on published volatile compounds that have been found in natural (processed) food products. Includes FEMA GRAS and EU-Flavis data.

9. REACH dossier

Pre-registered for 2010, no dossier available as of 11/11/19.

10. Conclusion

The existing information supports the use of this material as described in this safety assessment.

11. Summary

11.1. Human health endpoint summaries

11.1.1. Genotoxicity

Based on the current existing data, N-furfurylpyrrole does not present a concern for genotoxicity.

11.1.1.1. Risk assessment. N-Furfurylpyrrole was assessed in the BlueScreen assay and found negative for both cytotoxicity

*http://www.thecocodecente

(positive: < 80% relative cell density) and genotoxicity, with and without metabolic activation (RIFM, 2014). BlueScreen is a human cell-based assay for measuring the genotoxicity and cytotoxicity of chemical compounds and mixtures. Additional assays were considered to fully assess the potential mutagenic or clastogenic effects of the target material. The mutagenic activity of N-furfurylpyrrole has been evaluated in a bacterial reverse mutation assay (Ames test) conducted in compliance with GLP regulations and in accordance with OECD TG 471 using the standard plate incorporation method. Salmonella typhimurium strains TA98, TA100, TA1535, TA1537, and Escherichia coli strain WP2uvrA were treated with N-furfurylpyrrole in dimethyl sulfoxide (DMSO) at concentrations up to 5000 µg/plate. No increases in the mean number of revertant colonies were observed at any tested concentration in the presence or absence of S9 (RIFM, 2017a). Under the conditions of the study, N-furfurylpyrrole was not mutagenic in the Ames test.

The clastogenic activity of N-furfurylpyrrole was evaluated in an *in vitro* micronucleus test conducted in compliance with GLP regulations and in accordance with OECD TG 487. Human peripheral blood lymphocytes were treated with N-furfurylpyrrole in DMSO at concentrations up to 1470 μ g/mL in the presence and absence of metabolic activation (S9) for 4 h and in the absence of metabolic activation for 24 h. N-Furfurylpyrrole did not induce binucleated cells with micronuclei when tested up to cytotoxic levels concentration in either the presence or absence of an S9 activation system (RIFM, 2017b). Under the conditions of the study, N-furfurylpyrrole was considered to be non-clastogenic in the *in vitro* micronucleus test.

Based on the data available, N-furfurylpyrrole does not present a concern for genotoxic potential.

Additional References: None.

Literature Search and Risk Assessment Completed On: 01/17/ 18.

11.1.2. Repeated dose toxicity

There are insufficient repeated dose toxicity data on N-furfurylpyrrole or on any read-across materials. The total systemic exposure to N-furfurylpyrrole is below the TTC for the repeated dose toxicity endpoint of a Cramer Class III material at the current level of use.

11.1.2.1. Risk assessment. There are no repeated dose toxicity data on N-furfurylpyrrole or on any read-across materials that can be used to support the repeated dose toxicity endpoint. Like furan derivatives, furfurylpyrrole can form reactive metabolites capable of hepatotoxicity

at doses as low as 0.5 mg/kg/day (EFSA, 2017). Since the total systemic exposure to N-furfurylpyrrole (0.0005 μ g/kg/day) is below the TTC (1.5 μ g/kg/day; Kroes et al., 2007) for the repeated dose toxicity endpoint of a Cramer Class III material at the current level of use.

Additional References: RIFM, 1971.

Literature Search and Risk Assessment Completed On: 01/25/ 18.

11.1.3. Reproductive toxicity

There are insufficient reproductive toxicity data on N-furfurylpyrrole or on any read-across materials. The total systemic exposure to N-furfurylpyrrole is below the TTC for the reproductive toxicity endpoint of a Cramer Class III material at the current level of use.

11.1.3.1. Risk assessment. There are no reproductive toxicity data on N-furfurylpyrrole or on any read-across materials that can be used to support the reproductive toxicity endpoint. The total systemic exposure to N-furfurylpyrrole (0.0005 μ g/kg/day) is below the TTC (1.5 μ g/kg/day; Kroes et al., 2007; Laufersweiler et al., 2012) for the reproductive toxicity endpoint of a Cramer Class III material at the current level of use.

Additional References: None.

Literature Search and Risk Assessment Completed On: 01/25/17.

11.1.4. Skin sensitization

Based on the application of DST, N-furfurylpyrrole does not present a safety concern for skin sensitization under the current, declared levels of use.

11.1.4.1. *Risk assessment*. The chemical structure of this material indicates that it would not be expected to react with skin proteins (Roberts et al., 2007; Toxtree 2.6.13; OECD Toolbox v4.1). No predictive skin sensitization studies are available for N-furfurylpyrrole.

Acting conservatively, due to the insufficient data, the reported exposure was benchmarked utilizing the non-reactive DST of 900 μ g/ cm² (Safford, 2008; Safford et al., 2011; Roberts et al., 2015; Safford et al., 2015b). The current exposure from the 95th percentile concentration is below the DST for non-reactive materials when evaluated in all QRA categories. Table 1 provides the maximum acceptable concentration based on the non-reactive DST. These levels represent maximum acceptable concentrations based on the DST approach. These

Table 1

Maximum acceptable concentrations for N-furfurylpyrrole that present no appreciable risk for skin sensitization based on non-reactive DST.

^b No reported use.

levels represent maximum acceptable concentrations based on the DST approach. However, additional studies may show it could be used at higher levels.

Additional References: None.

Literature Search and Risk Assessment Completed On: 01/22/18.

11.1.5. Phototoxicity/photoallergenicity

Based on the available UV/Vis spectra, N-furfurylpyrrole would not be expected to present a concern for phototoxicity or photoallergenicity.

11.1.5.1. Risk assessment. There are no phototoxicity studies available for N-furfurylpyrrole in experimental models. UV/Vis absorption spectra indicate minor absorbance between 290 and 700 nm. The corresponding molar absorption coefficient is below the benchmark of concern for phototoxicity and photoallergenicity (Henry et al., 2009). Based on lack of significant absorbance in the critical range, N-furfurylpyrrole does not present a concern for phototoxicity or photoallergenicity.

11.1.5.2. UV spectra analysis. UV/Vis absorption spectra (OECD TG 101) for N-furfurylpyrrole were obtained. The spectra indicate minor absorbance in the range of 290–700 nm. The molar absorption coefficient is below the benchmark of concern for phototoxic effects, 1000 L mol⁻¹ \cdot cm⁻¹ (Henry et al., 2009).

Additional References: None.

Literature Search and Risk Assessment Completed On: 12/08/ 17.

11.1.6. Local respiratory toxicity

The MOE could not be calculated due to lack of appropriate data. The exposure level for N-furfurylpyrrole is below the Cramer Class III TTC value for inhalation exposure local effects.

11.1.6.1. *Risk assessment.* There are no inhalation data available on N-furfurylpyrrole. Based on the Creme RIFM Model, the inhalation exposure is 0.0000031 mg/day. This exposure is 151,613 times lower than the Cramer Class III TTC value of 0.47 mg/day (based on human lung weight of 650 g; Carthew et al., 2009); therefore, the exposure at the current level of use is deemed safe.

Additional References: None.

Literature Search and Risk Assessment Completed On: 01/27/ 18.

11.2. Environmental endpoint summary

11.2.1. Screening-level assessment

A screening-level risk assessment of N-furfurylpyrrole was performed following the RIFM Environmental Framework (Salvito et al., 2002), which provides 3 tiers of screening-level for aquatic risk. In Tier 1, only the material's regional VoU, its log K_{ow} and its molecular weight are needed to estimate a conservative risk quotient (RQ), expressed as the ratio Predicted Environmental Concentration/Predicted No Effect Concentration (PEC/PNEC). A general QSAR with a high uncertainty factor applied is used to predict fish toxicity, as discussed in Salvito et al. (2002). In Tier 2, the RQ is refined by applying a lower uncertainty factor to the PNEC using the ECOSAR model (US EPA, 2012b), which provides chemical class-specific ecotoxicity estimates. Finally, if necessary, Tier 3 is conducted using measured biodegradation and ecotoxicity data to refine the RQ, thus allowing for lower PNEC uncertainty factors. The data for calculating the PEC and PNEC for this safety assessment are provided in the table below. For the PEC, the range from the most recent IFRA Volume of Use Survey is reviewed. The PEC is then calculated using the RIFM Environmental Framework, N-furfurylpyrrole was identified as a fragrance material with no potential to present a possible risk to the aquatic environment (i.e., its screening-level PEC/PNEC < 1).

A screening-level hazard assessment using EPI Suite v4.11 (US EPA, 2012a) did not identify N-furfurylpyrrole as possibly persistent or bioaccumulative based on its structure and physical-chemical properties. This screening-level hazard assessment considers the potential for a material to be persistent and bioaccumulative and toxic, or very persistent and very bioaccumulative as defined in the Criteria Document (Api et al., 2015). As noted in the Criteria Document, the screening criteria applied are the same as those used in the EU for REACH (ECHA, 2012). For persistence, if the EPI Suite model BIOWIN 3 predicts a value < 2.2 and either BIOWIN 2 or BIOWIN 6 predicts a value <0.5, then the material is considered potentially persistent. A material would be considered potentially bioaccumulative if the EPI Suite model BCFBAF predicts a fish BCF \geq 2000 L/kg. Ecotoxicity is determined in the above screening-level risk assessment. If additional assessment is required based on these model outputs (Step 1), additional assessment is required, a WoE-based review is then performed (Step 2). This review considers available data on the material's physical-chemical properties, environmental fate (e.g., OECD Guideline biodegradation studies or die-away studies), fish bioaccumulation, and higher-tier model outputs (e.g., US EPA's BIOWIN and BCFBAF found in EPI Suite v4.11).

11.2.1. Risk assessment

Based on the current Volume of Use (2015), N-furfurylpyrrole presents no risk to the aquatic compartment in the screening-level assessment.

11.2.2. Key studies

11.2.2.1. Biodegradation. No data available.

11.2.2.2. Ecotoxicity. No data available.

11.2.2.3. Other available data. N-Furfurylpyrrole has been preregistered for REACH with no additional data at this time.

11.2.3. Risk assessment refinement

Ecotoxicological data and PNEC derivation (all endpoints reported in mg/L; PNECs in μ g/L).

Endpoints used to calculate PNEC are underlined.

LC50 (Fish)	EC50	EC50	AF	PNEC (µg/L)	Chemical Class
(mg/L)	(Daphnia)	(Algae)			
	\setminus	\setminus /			\setminus
72.92			1000000	0.07292	
	(mg/L)	(mg/L) (Daphnia)	(mg/L) (Daphnia) (Algae)	(mg/L) (Daphnia) (Algae)	(mg/L) (Daphnia) (Algae)

Exposure information and PEC calculation (following RIFM Environmental Framework: Salvito et al., 2002).

Exposure	Europe (EU)	North America (NA)
Log K _{ow} Used Biodegradation Factor Used	2.5 0	2.5 0
Dilution Factor	3	3
Regional Volume of Use Tonnage Band	< 1	< 1
Risk Characterization: PEC/PNEC	< 1	< 1

Based on available data, the RQ for this material is < 1. No further assessment is necessary.

The RIFM PNEC is 0.07292 μ g/L. The revised PEC/PNECs for EU and NA are: not applicable. The material was cleared at the screening-level and therefore does not present a risk to the aquatic environment at the current reported volumes of use.

Literature Search and Risk Assessment Completed On: 01/24/ 18.

The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper. We wish to confirm that there are no known conflicts of interest associated with this publication and there has been no significant financial support for this work that could have influenced its outcome. RIFM staff are employees of the Research Institute for Fragrance Materials, Inc. (RIFM). The Expert Panel receives a small honorarium for time spent reviewing the subject work.
