#### Abbreviation/Definition List:

- 2-Box Model A RIFM, Inc. proprietary in silico tool used to calculate fragrance air exposure concentration
- AF Assessment Factor
- BCF Bioconcentration Factor
- Creme RIFM Model The Creme RIFM Model uses probabilistic (Monte Carlo) simulations to allow full distributions of data sets, providing a more realistic estimate of aggregate exposure to individuals across a population (Comiskey et al., 2015, 2017; Safford et al., 2015a, 2017) compared to a deterministic aggregate approach
- DEREK Derek Nexus is an in silico tool used to identify structural alerts
- DRF Dose Range Finding
- DST Dermal Sensitization Threshold
- ECHA European Chemicals Agency
- ECOSAR Ecological Structure-Activity Relationships Predictive Model
- EU Europe/European Union
- GLP Good Laboratory Practice
- IFRA The International Fragrance Association
- LOEL Lowest Observable Effect Level
- MOE Margin of Exposure
- MPPD Multiple-Path Particle Dosimetry. An in silico model for inhaled vapors used to
- simulate fragrance lung deposition
- NA North America
- NESIL No Expected Sensitization Induction Level
- NOAEC No Observed Adverse Effect Concentration
- NOAEL No Observed Adverse Effect Level
- NOEC No Observed Effect Concentration
- NOEL No Observed Effect Level
- OECD Organisation for Economic Co-operation and Development
- OECD TG Organisation for Economic Co-operation and Development Testing Guidelines
- PBT Persistent, Bioaccumulative, and Toxic
- PEC/PNEC Predicted Environmental Concentration/Predicted No Effect Concentration
- Perfumery In this safety assessment, perfumery refers to fragrances made by a perfumer used in consumer products only. The exposures reported in the safety assessment include consumer product use, but do not include occupational exposures.
- QRA Quantitative Risk Assessment
- QSAR Quantitative Structure-Activity Relationship
- REACH Registration, Evaluation, Authorisation, and Restriction of Chemicals RfD - Reference Dose
- RIFM Research Institute for Fragrance Materials
- RO Risk Quotient
- Statistically Significant Statistically significant difference in reported results as compared to controls with a p < 0.05 using appropriate statistical test
- TTC Threshold of Toxicological Concern
- UV/Vis spectra Ultraviolet/Visible spectra
- VCF Volatile Compounds in Food
- VoU Volume of Use
- vPvB (very) Persistent, (very) Bioaccumulative
- WoE Weight of Evidence
- The Expert Panel for Fragrance Safety\* concludes that this material is safe as described in this safety assessment.
- This safety assessment is based on the RIFM Criteria Document (Api, 2015), which should be referred to for clarifications.
- Each endpoint discussed in this safety assessment includes the relevant data that were available at the time of writing (version number in the top box is indicative of the date of approval based on a 2-digit month/day/year), both in the RIFM Database (consisting of publicly available and proprietary data) and through publicly available information sources (e.g., SciFinder and PubMed). Studies selected for this safety assessment were based on appropriate test criteria, such as acceptable guidelines, sample size, study duration, route of exposure, relevant animal species, most relevant testing endpoints, etc. A key study for each endpoint was selected based on the most conservative endpoint value (e.g., PNEC, NOAEL, LOEL, and NESIL).

(continued on next column)

#### (continued)

\*The Expert Panel for Fragrance Safety is an independent body that selects its own members and establishes its own operating procedures. The Expert Panel is comprised of internationally known scientists that provide RIFM with guidance relevant to human health and environmental protection.

#### Summary: The existing information supports the use of this material as described in this safety assessment.

2-Ethyl-1,3,3-trimethyl-2-norbornanol was evaluated for genotoxicity, repeated dose toxicity, reproductive toxicity, local respiratory toxicity, phototoxicity/ photoallergenicity, skin sensitization, and environmental safety. Data show that 2ethyl-1,3,3-trimethyl-2-norbornanol is not genotoxic. The repeated dose, reproductive, and local respiratory toxicity endpoints were evaluated using the Threshold of Toxicological Concern (TTC) for a Cramer Class II material, and the exposure to 2-ethyl-1,3,3-trimethyl-2-norbornanol is below the TTC (0.009 mg/kg/ day, 0.009 mg/kg/day, and 0.47 mg/day, respectively). The skin sensitization endpoint was completed using the Dermal Sensitization Threshold (DST) for nonreactive materials (900 µg/cm<sup>2</sup>); exposure is below the DST. The phototoxicity/ photoallergenicity endpoints were evaluated based on ultraviolet (UV) spectra; 2ethyl-1,3,3-trimethyl-2-norbornanol is not expected to be phototoxic/ photoallergenic. The environmental endpoints were evaluated; 2-ethyl-1,3,3-trimethyl-2-norbornanol was found not to be Persistent, Bioaccumulative, and Toxic (PBT) as per the International Fragrance Association (IFRA) Environmental Standards, and its risk quotients, based on its current volume of use in Europe and North America (i.e., Predicted Environmental Concentration/Predicted No Effect Concentration [PEC/PNEC]), are <1.

Human Health Safety Assessment

Genotoxicity: Not genotoxic.

Repeated Dose Toxicity: No NOAEL available. Exposure is below TTC. Reproductive Toxicity: No NOAEL available. Exposure is below TTC. Skin Sensitization: No safety concerns at current, declared use levels; the exposure is below the DST. Phototoxicity/Photoallergenicity: Not expected to be phototoxic/photoallergenic. Local Respiratory Toxicity: No NOAEC available. Exposure is below the TTC. Environmental Safety Assessment Hazard Assessment: Persistence: Screening-level: 2.16 (BIOWIN 3) (EPI Suite v4.11; US EPA, 2012a) Bioaccumulation: Screening-level: 148.5 L/kg (EPI Suite v4 11: US EPA 2012a) Ecotoxicity: Screening-level: Fish LC50: 6.68 mg/L (RIFM Framework; Salvito, 2002)

Conclusion: Not PBT or vPvB as per IFRA Environmental Standards

**Risk Assessment:** Screening-level: PEC/PNEC (North America

- and Europe) < 1Critical Ecotoxicity Endpoint: Fish LC50: 6.68
- mg/L RIFM PNEC is: 0.00668 µg/L

• Revised PEC/PNECs (2015 IFRA VoU):

North America and Europe: Not applicable: Cleared at screening-level

Expert Judgment	Toxtree v3.1	OECD QSAR Toolbox v3.2
II	III	Ι

\*Due to potential discrepancies with the current *in silico* tools (Bhatia et al., 2015), the Cramer class of the target material was determined using expert judgment based on the Cramer decision tree (Cramer et al., 1978). See the Appendix below for further details.

## 2. Analogs Selected:

- a. Genotoxicity: None
- b. Repeated Dose Toxicity: None
- c. Reproductive Toxicity: None
- d. Skin Sensitization: None
- e. Phototoxicity/Photoallergenicity: None
- f. Local Respiratory Toxicity: None
- g. Environmental Toxicity: None
- 3. Read-across Justification: None

## 7. Metabolism

No relevant data available for inclusion in this safety assessment. Additional References: None.

#### 8. Natural occurrence (discrete chemical) or composition (NCS)

2-Ethyl-1,3,3-trimethyl-2-norbornanol and additional materials ethyl-1,3,3-trimethylbicyclo[2.2.1]heptan-2-ol and bicyclo[2.2.1] heptan-2-ol, 2-ethyl-1,3,3-trimethyl-, (1R,2R,4S)- are not reported to occur in foods by the VCF\*.

\*VCF (Volatile Compounds in Food): Database/Nijssen, L.M.; Ingen-Visscher, C.A. van; Donders, J.J.H. (eds). – Version 15.1 – Zeist (The Netherlands): TNO Triskelion, 1963–2014. A continually updated database containing information on published volatile compounds that have been found in natural (processed) food products. Includes FEMA GRAS and EU-Flavis data.

## 9. REACH dossier

No dossiers available as of 10/28/20.

## 10. Conclusion

The existing information supports the use of this material as described in this safety assessment.

#### 11. Summary

## 11.1. Human health endpoint summaries

#### 11.1.1. Genotoxicity

Based on the current existing data, 2-ethyl-1,3,3-trimethyl-2-norbornanol does not present a concern for genotoxicity.

11.1.1.1. Risk assessment. 2-Ethyl-1,3,3-trimethyl-2-norbornanol was assessed in the BlueScreen assay and found negative for both cytotoxicity (positive: <80% relative cell density) and genotoxicity, with and without metabolic activation (RIFM, 2013).

The mutagenic activity of 2-ethyl-1,3,3-trimethyl-2-norbornanol has been evaluated in a bacterial reverse mutation assay conducted in compliance with GLP regulations and in accordance with OECD TG 471 using the standard plate incorporation method (RIFM, 2017b). Salmonella typhimurium strains TA98, TA100, TA1535, TA1537, and Escherichia coli strain WP2uvrA were treated with 2-ethyl-1,3, 3-trimethyl-2-norbornanol in dimethyl sulfoxide (DMSO) at concentrations up to 5000  $\mu$ g/plate. A >3 fold increase in the mean number of revertant colonies was observed at concentrations  $\geq 1600 \ \mu g/plate$  in TA1535 in the presence of S9 in the initial and confirmatory assays. A >3-fold increase was also observed at 1600 µg/plate in TA1535 in the absence of S9 only in the initial assay. No increases in the mean number of revertant colonies were observed at any tested concentration in the presence or absence of S9 in any other tester strain (RIFM, 2017b). Under the conditions of the study, 2-ethyl-1,3,3-trimethyl-2-norbornanol was considered to be mutagenic in the Ames test. In order to verify the biological relevance of the results in the *in vitro* Ames study, the genotoxic activity of 2-ethyl-1,3,3-trimethyl-2-norbornanol was evaluated in a combined in vivo COMET/micronucleus test conducted in compliance with GLP regulations. The test material was administered in corn oil via oral gavage to groups of male and female CD-1 mice. Doses of 125, 250, or 500 mg/kg were administered for 4 consecutive days. Mice from each dose level were euthanized at 3-4 h post last dose and blood was collected and examined for micronuclei evaluation; the liver was used for the COMET assay analysis. The test material did not induce a statistically significant increase in the incidence of micronucleated polychromatic erythrocytes in blood or induced a significant increase in DNA damage in the liver (RIFM, 2017c). Under the conditions of the study, 2-ethyl-1,3,3-trimethyl-2-norbornanol was considered to be non-genotoxic in the combined in vivo COMET/micronucleus test.

The clastogenic activity of 2-ethyl-1,3,3-trimethyl-2-norbornanol was evaluated in an *in vitro* micronucleus test conducted in compliance with GLP regulations and in accordance with OECD TG 487. Human peripheral blood lymphocytes were treated with 2-ethyl-1,3,3-trimethyl-2-norbornanol in DMSO at concentrations up to 1823 µg/mL in a dose range finding (DRF) study; micronuclei analysis was conducted at concentrations up to 162 µg/mL in the presence and absence of metabolic activation. 2-Ethyl-1,3,3-trimethyl-2-norbornanol did not induce binucleated cells with micronuclei when tested up to cytotoxic levels concentration in either the presence or absence of an S9 activation system (RIFM, 2017a). Under the conditions of the study, 2-ethyl-1,3, 3-trimethyl-2-norbornanol was considered to be non-clastogenic in the *in vitro* micronucleus test.

Based on the data available, 2-ethyl-1,3,3-trimethyl-2-norbornanol does not present a concern for genotoxic potential.

Additional References: None.

Literature Search and Risk Assessment Completed On: 02/26/20.

#### 11.1.2. Repeated dose toxicity

There are insufficient repeated dose toxicity data on 2-ethyl-1,3,3trimethyl-2-norbornanol or any read-across materials. The total systemic exposure to 2-ethyl-1,3,3-trimethyl-2-norbornanol is below the TTC for the repeated dose toxicity endpoint of a Cramer Class II material at the current level of use.

11.1.2.1. Risk assessment. There are no repeated dose toxicity data on 2-ethyl-1,3,3-trimethyl-2-norbornanol or any read-across materials that can be used to support the repeated dose toxicity endpoint. The total systemic exposure (0.51  $\mu$ g/kg/day) is below the TTC for the repeated dose toxicity endpoint (9  $\mu$ g/kg/day; Kroes, 2007).

Additional References: None.

Literature Search and Risk Assessment Completed On: 02/12/ 20.

#### 11.1.3. Reproductive toxicity

There are insufficient reproductive toxicity data on 2-ethyl-1,3,3-trimethyl-2-norbornanol or any read-across materials. The total systemic exposure to 2-ethyl-1,3,3-trimethyl-2-norbornanol is below the TTC for the reproductive toxicity endpoint of a Cramer Class II material at the current level of use.

11.1.3.1. Risk assessment. There are no reproductive toxicity data on 2ethyl-1,3,3-trimethyl-2-norbornanol or any read-across materials that can be used to support the reproductive toxicity endpoint. The total systemic exposure (0.51  $\mu$ g/kg/day) is below the TTC for the reproductive toxicity endpoint (9  $\mu$ g/kg/day; Kroes, 2007; Laufersweiler, 2012).

## Additional References: None.

Literature Search and Risk Assessment Completed On: 02/21/20.

## 11.1.4. Skin sensitization

Based on the application of DST, 2-ethyl-1,3,3-trimethyl-2-norbornanol and its isomers, ethyl-1,3,3-trimethylbicyclo[2.2.1]heptan-2-ol and bicyclo[2.2.1]heptan-2-ol, 2-ethyl-1,3,3-trimethyl-, (1R,2R,4S)-, do not present a concern for skin sensitization under the current, declared levels of use.

11.1.4.1. Risk assessment. The chemical structures of 2-ethyl-1,3,3-trimethyl-2-norbornanol and its isomers, ethyl-1,3,3-trimethylbicyclo [2.2.1]heptan-2-ol and bicyclo[2.2.1]heptan-2-ol, 2-ethyl-1,3,3-trimethyl-, (1R,2R,4S)-, indicate that they would not be expected to react with skin proteins directly (Roberts, 2007; Toxtree v3.1.0; OECD Toolbox v4.2). No predictive skin sensitization studies are available for these materials. Due to the absence of data, the reported exposure was benchmarked utilizing the non-reactive DST of 900 µg/cm<sup>2</sup> (Safford, 2008, 2011, 2015b; Roberts, 2015). The current exposure from the 95th percentile concentration is below the DST for non-reactive materials when evaluated in all QRA categories. Table 1 provides the maximum acceptable concentrations for 2-ethyl-1,3,3-trimethyl-2-norbornanol and its isomer that present no appreciable risk for skin sensitization based on the non-reactive DST. These levels represent maximum acceptable concentrations based on the DST approach. However, additional studies may show it could be used at higher levels.

Additional References: None.

Literature Search and Risk Assessment Completed On: 02/03/20.

## 11.1.5. Phototoxicity/photoallergenicity

Based on the available UV/Vis spectra, 2-ethyl-1,3,3-trimethyl-2norbornanol would not be expected to present a concern for phototoxicity or photoallergenicity.

11.1.5.1. Risk assessment. There are no phototoxicity studies available for 2-ethyl-1,3,3-trimethyl-2-norbornanol in experimental models. UV/ Vis absorption spectra indicate no significant absorption between 290 and 700 nm. The corresponding molar absorption coefficient is well below the benchmark of concern for phototoxicity and photo-allergenicity (Henry, 2009). Based on the lack of absorbance, 2-ethyl-1, 3,3-trimethyl-2-norbornanol does not present a concern for phototoxicity or photoallergenicity.

11.1.5.2. UV spectra analysis. UV/Vis absorption spectra (OECD TG 101) were obtained. The spectra indicate no significant absorbance in the range of 290–700 nm. The molar absorption coefficient is below the benchmark of concern for phototoxic effects, 1000 L mol<sup>-1</sup>  $\cdot$  cm<sup>-1</sup> (Henry, 2009).

#### Additional References: None.

Literature Search and Risk Assessment Completed On: 02/18/20.

#### Table 1

Maximum acceptable concentrations for 2-ethyl-1,3,3-trimethyl-2-norbornanol, ethyl-1,3,3-trimethylbicyclo[2.2.1]heptan-2-, and bicyclo[2.2.1]heptan-2-ol, 2-ethyl-1,3,3-trimethyl-, (1R,2R,4S)- that present no appreciable risk for skin sensitization based on non-reactive DST.

<sup>b</sup> No reported use.

<sup>c</sup> Fragrance exposure from these products is very low. These products are not currently in the Creme RIFM Aggregate Exposure Model.

#### 11.1.6. Local respiratory toxicity

The margin of exposure could not be calculated due to a lack of appropriate data. The exposure level for 2-ethyl-1,3,3-trimethyl-2-norbornanol is below the Cramer Class III TTC value for inhalation exposure local effects.

11.1.6.1. *Risk assessment.* There are no inhalation data available on 2-ethyl-1,3,3-trimethyl-2-norbornanol. Based on the Creme RIFM Model, the inhalation exposure is 0.019 mg/day. This exposure is 24.7 times lower than the Cramer Class III TTC value of 0.47 mg/day (based on human lung weight of 650 g; Carthew, 2009); therefore, the exposure at the current level of use is deemed safe.

\*As per Carthew et al. (2009), Cramer Class II materials default to Cramer Class III for the local respiratory toxicity endpoint.

Additional References: None.

Literature Search and Risk Assessment Completed On: 02/26/20.

#### 12. Environmental endpoint summary

#### 12.1. Screening-level assessment

A screening-level risk assessment of 2-ethyl-1,3,3-trimethyl-2-norbornanol was performed following the RIFM Environmental Framework (Salvito, 2002), which provides 3 tiered levels of screening for aquatic risk. In Tier 1, only the material's regional VoU, its log  $K_{OW}$ , and its molecular weight are needed to estimate a conservative risk quotient (RQ), expressed as the ratio Predicted Environmental Concentration/Predicted No Effect Concentration (PEC/PNEC). A general QSAR with a high uncertainty factor applied is used to predict fish toxicity, as discussed in Salvito et al. (2002). In Tier 2, the RQ is refined by applying a lower uncertainty factor to the PNEC using the ECOSAR model (US EPA, 2012b), which provides chemical class-specific ecotoxicity estimates. Finally, if necessary, Tier 3 is conducted using measured biodegradation and ecotoxicity data to refine the RQ, thus allowing for lower PNEC uncertainty factors. The data for calculating the PEC and PNEC for this safety assessment are provided in the table below. For the PEC, the range from the most recent IFRA Volume of Use Survey is reviewed. The PEC is then calculated using the actual regional tonnage, not the extremes of the range. Following the RIFM Environmental Framework, 2-ethyl-1,3,3-trimethyl-2-norbornanol was identified as a fragrance material with no potential to present a possible risk to the aquatic environment (i.e., its screening-level PEC/PNEC <1).

A screening-level hazard assessment using EPI Suite v4.11 (US EPA, 2012a) identified 2-ethyl-1,3,3-trimethyl-2-norbornanol as possibly persistent but not bioaccumulative based on its structure and physical–chemical properties. This screening-level hazard assessment considers the potential for a material to be persistent *and* bioaccumulative *and* toxic, or very persistent *and* very bioaccumulative as defined in the Criteria Document (Api, 2015). As noted in the Criteria Document, the screening criteria applied are the same as those used in the EU for REACH (ECHA, 2012). For persistence, if the EPI Suite model BIOWIN 3 predicts a value < 2.2 and either BIOWIN 2 or BIOWIN 6 predicts a value < 0.5, then the material is considered potentially persistent. A material would be considered potentially bioaccumulative if the EPI Suite model BCFBAF predicts a fish BCF  $\geq$ 2000 L/kg. Ecotoxicity is determined in the above screening-level risk assessment. If, based on

these model outputs (Step 1), additional assessment is required, a WoE-based review is then performed (Step 2). This review considers available data on the material's physical-chemical properties, environmental fate (e.g., OECD Guideline biodegradation studies or die-away studies), fish bioaccumulation, and higher-tier model outputs (e.g., US EPA's BIOWIN and BCFBAF found in EPI Suite v4.11).

#### 12.1.1. Risk assessment

Based on the current Volume of Use (2015), 2-ethyl-1,3,3-trimethyl-2-norbornanol presents no risk to the aquatic compartment in the screening-level assessment.

## 12.1.2. Key studies

12.1.2.1. Biodegradation. No data available.

## 12.1.2.2. Ecotoxicity. No data available.

## 12.1.3. Other available data

2-Ethyl-1,3,3-trimethyl-2-norbornanol has been pre-registered for REACH with no additional information available at this time.

*12.1.3.1. Risk assessment refinement.* Ecotoxicological data and PNEC derivation (all endpoints reported in mg/L; PNECs in µg/L)

Endpoints used to calculate PNEC are underlined.

Exposure information and PEC calculation (following RIFM Environmental Framework: Salvito, 2002)

Exposure	Europe (EU)	North America (NA)
Log K <sub>OW</sub> Used	3.8	3.8
Biodegradation Factor Used	0	0
Dilution Factor	3	3
Regional Volume of Use Tonnage Band*	<1	<1
<b>Risk Characterization: PEC/PNEC</b>	<1	<1

\*Combined Regional Volume of Use for all CAS #s.

Based on available data, the RQ for this material is < 1. No further assessment is necessary.

The RIFM PNEC is  $0.00668 \ \mu g/L$ . The revised PEC/PNECs for EU and NA are not applicable. The material was cleared at the screening-level; therefore, it does not present a risk to the aquatic environment at the current reported volumes of use.

Literature Search and Risk Assessment Completed On: 02/24/20.

#### Declaration of competing interest

The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper. We wish to confirm that there are no known conflicts of interest associated with this publication and there has been no significant financial support for this work that could have influenced its outcome. RIFM staff are employees of the Research Institute for Fragrance Materials, Inc. (RIFM). The Expert Panel receives a small honorarium for time spent reviewing the subject work.

#### Appendix

#### Explanation of Cramer Classification

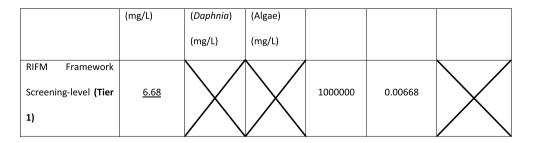

Due to potential discrepancies between the current *in silico* tools (Bhatia et al., 2015), the Cramer Class of the target material was determined using expert judgment, based on the Cramer decision tree.

- Q1. Normal constituent of the body? No
- Q2. Contains functional groups associated with enhanced toxicity? No
- Q3. Contains elements other than C, H, O, N, and divalent S? No
- Q5. Simply branched aliphatic hydrocarbon or a common carbohydrate? No
- Q6. Benzene derivative with certain substituents? No

Q7. Heterocyclic? No

Q16. Common terpene? (see Cramer et al., 1978 for detailed explanation)? No

Q17. Readily hydrolyzed to a common terpene? No Q19. Open chain? No

Q23. Aromatic? No

Q24. Monocarbocyclic with simple substituents? No

Q25. Cyclopropane? No

Q26. Monocycloalkanone or a bicyclocompound? Yes, Class Intermediate (Class II)
