Version: 050319. This version replaces any previous versions.
Name: 10-Undecenoic acid
CAS Registry Number: 112-38-9

Abbreviation/Definition List:

- 2-Box Model - A RIFM, Inc. proprietary in silico tool used to calculate fragrance air exposure concentration
- AF - Assessment Factor
- BCF - Bioconcentration Factor
- Creme RIFM Model - The Creme RIFM Model uses probabilistic (Monte Carlo) simulations to allow full distributions of data sets, providing a more realistic estimate of aggregate exposure to individuals across a population (Comiskey et al., 2015, 2017; Safford et al., 2015a, 2017) compared to a deterministic aggregate approach
- DEREK - Derek Nexus is an in silico tool used to identify structural alerts
- DRF - Dose Range Finding
- DST - Dermal Sensitization Threshold
- ECHA - European Chemicals Agency
- ECOSAR - Ecological Structure-Activity Relationships Predictive Model
- EU - Europe/European Union
- GLP - Good Laboratory Practice
- IFRA - The International Fragrance Association
- LOEL - Lowest Observable Effect Level
- MOE - Margin of Exposure
- MPPD - Multiple-Path Particle Dosimetry. An in silico model for inhaled vapors used to simulate fragrance lung deposition

1. Identification

1. Chemical Name: 10-Undecenoic acid
2. CAS Registry Number: 112-38-9
3. Synonyms: 10-Hendecenoic acid; Undecylenic acid; Undecenoic acid; 10-Undecenoic acid; 10-Undecenoic acid
4. Molecular Formula: C₁₁H₂₀O₂
5. Molecular Weight: 184.27
6. RIFM Number: 824
7. Stereochemistry: Stereoisomer not specified. No stereocenter present and no stereoisomer possible.

2. Physical data

1. Boiling Point: 137 °C @ 2 mm Hg (Fragrance Materials Association [FMA]), 293.11 °C (EPI Suite)
2. Flash Point: 158 °C (Globally Harmonized System), > 200 °F; CC (FMA)
3. Log Kow: 4.37 (EPI Suite)
4. Melting Point: 71.46 °C (EPI Suite)
5. Water Solubility: 6.84 mg/L (EPI Suite)
6. Specific Gravity: 0.912 (FMA), 0.9109 (Essential Oil Association, 1976 Sample 76–269)
7. Vapor Pressure: 0.00428 mm Hg @ 20 °C (EPI Suite v4.0), 0.022 mm Hg 20 °C (FMA), 0.00701 mm Hg @ 25 °C (EPI Suite)

The Expert Panel for Fragrance Safety* concludes that this material is safe as described in this safety assessment. Each endpoint discussed in this safety assessment includes the relevant data that were available at the time of writing (version number in the top box is indicative of the date of approval based on a 2-digit month/day/year), both in the RIFM Database (consisting of publicly available and proprietary data) and through publicly available information sources (e.g., SciFinder and PubMed). Studies selected for this safety assessment were based on appropriate test criteria, such as acceptable guidelines, sample size, study duration, route of exposure, relevant animal species, most relevant testing endpoints, etc. A key study for each endpoint was selected based on the most conservative endpoint value (e.g., PNEC, NOAEC, LOEL, and NESIL).

*The Expert Panel for Fragrance Safety is an independent body that selects its own members and establishes its own operating procedures. The Expert Panel is comprised of internationally known scientists that provide RIFM with guidance relevant to human health and environmental protection.

Summary: The existing information supports the use of this material as described in this safety assessment. 10-Undecenoic acid was evaluated for genotoxicity, repeated dose toxicity, reproductive toxicity, local respiratory toxicity, phototoxicity/photoallergenicity, skin sensitization, and environmental safety. Data show that 10-undecenoic acid is not genotoxic. Data on 10-undecenoic acid provide a calculated Margin of Exposure (MOE) > 100 for the repeated dose toxicity and reproductive toxicity endpoints. The skin sensitization endpoint was completed using the Dermal Sensitization Threshold (DST) for reactive materials (64 μg/μL); exposure is below the DST. The phototoxicity/photoallergenicity endpoint was evaluated based on ultraviolet (UV) spectra; 10-undecenoic acid is not expected to be phototoxic/photoallergenic. The local respiratory toxicity endpoint was evaluated using the Threshold of Toxicological Concern (TTC) for a Cramer Class I material, and the exposure to 10-undecenoic acid is below the TTC (1.4 mg/day). The environmental endpoints were evaluated; 10-undecenoic acid was found not to be persistent, bioaccumulative, and toxic (PBT) as per the International Fragrance Association (IFRA) Environmental Standards, and its risk quotients, based on its current volume of use in Europe and North America (i.e., Predicted Environmental Concentration/Predicted No Effect Concentration [PEC/PNEC]), are < 1. (ECHA REACH Dossier: Undec-10-enoic acid; ECHA, 2010)

(ECHA REACH Dossier: Undec-10-enoic acid; ECHA, 2010)

1. Identification
2. Physical data
8. UV Spectra: No significant absorbance between 290 and 700 nm; molar absorption coefficient is below the benchmark (1000 L mol⁻¹ · cm⁻¹)

9. Appearance/Organoleptic: Artectand Volume II 1969: Colorless leafy crystals or fused mass. The odor varies enormously in different grades of acid, from oily, mildly acid, and heavy-fruity, overall pleasant, to acrid-acid, repulsively sour-fatty. However, for perfumery or flavor purposes, the latter type would be absolutely out of the question. A very highly refined grade of this acid has a faintly peach-like odor, accompanied by a waxy-fatty, mildly sour-sweet note which gives an overall pleasant impression. The “normal” grade, which is an industrial chemical, produced in a volume of thousands of tons, has a much inferior color, odor, and general appearance.

3. Volume of use (worldwide band)
1. 0.1–1 metric ton per year (IFRA, 2015)

4. Exposure to fragrance ingredient (Creme RIFM aggregate exposure model v1.0)
1. 95th Percentile Concentration in Hydroalcoholics: 0.0045% (RIFM, 2016)
2. Inhalation Exposure*: 0.0000021 mg/kg/day or 0.00016 mg/kg/day (RIFM, 2016)
3. Total Systemic Exposure**: 0.000078 mg/kg/day (RIFM, 2016)

*95th percentile calculated exposure derived from concentration survey data in the Creme RIFM Aggregate Exposure Model (Comiskey et al., 2015; Safford et al., 2015a; Safford et al., 2017; and Comiskey et al., 2017).

**95th percentile calculated exposure; assumes 100% absorption unless modified by dermal absorption data as reported in Section V. It is derived from concentration survey data in the Creme RIFM Aggregate Exposure Model and includes exposure via dermal, oral, and inhalation routes whenever the fragrance ingredient is used in products that include these routes of exposure (Comiskey et al., 2015; Safford et al., 2015a; Safford et al., 2017; and Comiskey et al., 2017).

5. Derivation of systemic absorption
1. Dermal: Assumed 100%
2. Oral: Assumed 100%
3. Inhalation: Assumed 100%

6. Computational toxicology evaluation
1. Cramer Classification: Class I, Low

7. Metabolism
No relevant data available for inclusion in this safety assessment.

Additional References:
None.

8. Natural occurrence (discrete chemical) or composition (NCS)

10-Undecenoic acid is reported to occur in the following foods by the VCF*:
Milk and milk products.

9. REACH dossier
Available; accessed 05/03/19 (ECHA, 2010).

10. Conclusion
The existing information supports the use of this material as described in this safety assessment.

11. Summary

11.1. Human health endpoint summaries

11.1.1. Genotoxicity
Based on the current existing data, 10-undecenoic acid does not present a concern for genotoxicity.

11.1.1.1. Risk assessment. 10-Undecenoic acid was assessed in the BlueScreen assay and found positive for cytotoxicity (positive: < 80% relative cell density) and negative for genotoxicity, with and without metabolic activation (RIFM, 2013). BlueScreen HC is a human cell-based assay for measuring the genotoxicity and cytotoxicity of chemical compounds and mixtures. Additional assays were considered to fully assess the potential mutagenic or clastogenic effects of the target material.

The mutagenic activity of 10-undecenoic acid has been evaluated in a bacterial reverse mutation assay conducted in compliance with GLP regulations and equivalent to OECD TG 471 using the standard plate incorporation method. Salmonella typhimurium strains TA98, TA100, TA1535, TA1537, and TA1538 were treated with 10-undecenoic acid in dimethyl sulfoxide (DMSO) at concentrations up to 5000 μg/mL. No increases in the mean number of revertant colonies were observed at any tested concentration in the presence or absence of S9 (ECHA, 2010). Under the conditions of the study, 10-undecenoic acid was not mutagenic in the Ames test.

In addition, in a mammalian cell gene mutation assay conducted according to GLP regulations and OECD TG 476, Chinese hamster lung fibroblast (V79) cells were treated with 10-undecenoic acid in DMSO at concentrations up to 600 μg/mL for 3 h in the presence and absence of metabolic activation. No increases in the frequency of mutant colonies were observed with any concentration of the test material, either with or without metabolic activation (ECHA, 2010). Under the conditions of the study, 10-undecenoic acid was not mutagenic to mammalian cells in vitro.

The clastogenic activity of 10-undecenoic acid was evaluated in an in vivo micronucleus test conducted in compliance with GLP regulations.
and in accordance with OECD TG 474. The test material was administered in 10% gum Arabic via oral gavage to groups of male and female CD-1 mice. Doses of 1000, 2000, or 4000 mg/kg body weight were administered. Mice from each dose level were euthanized at 24, 48, or 72 h, and the bone marrow was extracted and examined for polychromatic erythrocytes. The test material did not induce a statistically significant increase in the incidence of micronucleated polychromatic erythrocytes in the bone marrow (ECHA, 2010). Under the conditions of the study, 10-undecenoic acid was considered to be not clastogenic in the in vivo micronucleus test.

Based on the available data, 10-undecenoic acid does not present a concern for genotoxic potential.

**Additional References:** ECHA, 2010.

**Literature Search and Risk Assessment Completed On:** 06/14/19.

### 11.1.2. Repeated dose toxicity

The MOE for 10-undecenoic acid is adequate for the repeated dose toxicity endpoint at the current level of use.

#### 11.1.2.1. Risk assessment.

There are sufficient repeated dose toxicity data on 10-undecenoic acid. In an OECD 408 and GLP-compliant subchronic toxicity study, 10 Sprague Dawley rats/sex/dose were administered undecylenic acid sodium salt (purity: 98.5%) through gavage at doses of 0 (vehicle control: water), 20, 60, and 180 mg/kg/day (180 mg/kg/day up to day 50, and 360 mg/kg/day afterwards) for 90 days. A recovery group of 10 rats/sex/day was maintained for 28 days after the end of treatment duration. No treatment-related mortality was reported during the study. No treatment-related adverse effects were observed for other tested parameters except bodyweight gain, food consumption, and cardiomyopathy. In the high-dose group, bodyweight gain and food consumption were reduced in males after increasing the dose to 360 mg/kg/day (day 50 onwards). In addition, a dose-dependent increase in severity was reported for treatment-related ptyalism, labored breathing, and poor clinical condition but the frequency was unknown. In addition, a dose-dependent increase in incidences of cardiomyopathy was observed with the increase being statistically significant only at the highest dose. Myocardial degeneration and mononuclear cell aggregation observed in the high-dose group was reversed following a recovery period. Since the study did not report any change in male bodyweight gain, food consumption, and cardiomyopathy (both sexes) following a recovery period, these changes were considered to be treatment-related adverse effects. Thus, based on the treatment-related effects of decreased bodyweight gain and food consumption in males combined with increased incidences of cardiomyopathy (in both sexes) at the high dose, the NOAEL for repeated dose toxicity was considered to be 60 mg/kg/day (ECHA, 2010).

Other studies on the target material yielding significantly higher NOAELs for the repeated dose toxicity endpoint are summarized below in Table 1.

Therefore, the MOE can be calculated by dividing the NOAEL for the sodium salt of 10-undecenoic acid by the total systemic exposure to 10-undecenoic acid, 60 mg/kg/day/0.000078 mg/kg/day or 769231.

In addition, the total systemic exposure to 10-undecanoic acid (0.078 μg/kg/day) is below the TTC (30 μg/kg/day; Kroes et al., 2007) for the repeated dose toxicity endpoint of a Cramer Class I material at the current level of use.

**Additional References:** Tislow et al., 1950.

**Literature Search and Risk Assessment Completed On:** 06/10/19.

### 11.1.3. Reproductive toxicity

The MOE for 10-undecenoic acid is adequate for the reproductive toxicity endpoint at the current level of use.

A.M. Api, et al. Food and Chemical Toxicology 141 (2020) 111380
11.1.3.1. Risk assessment. There are sufficient reproductive toxicity data on 10-undecanoic acid that can be used to support the reproductive toxicity endpoint.

In an OECD 421/GLP study, groups of 10 Sprague Dawley rats/sex were administered the test material 10-undecanoic acid via oral gavage at doses of 0, 50, 150, or 450 mg/kg/day in corn oil. Mortality was reported among 2 high-dose males on treatment days 3 and 35; this was considered to be treatment-related though the cause of death could not be determined due to the lack of antemortem clinical signs of toxicity and no evident adverse effects were observed during macroscopic examination. Hypersalivation and respiratory difficulties were reported among the high-dose group animals. Incidences of hypersalivation were also observed among the mid- and low-dose group animals, but to a lower degree as compared to the high-dose group animals. One mid-dose male was reported to have transient loud breathing. There were no treatment-related alterations in the reproductive performance or on the development of pups at any dose level. Thus, the NOAEL for parental toxicity was considered to be 150 mg/kg/day, based on mortality and clinical signs of toxicity among the high-dose group animals. The NOAEL for fertility effects and on the development of pups was considered to be 450 mg/kg/day, the highest dose tested (ECHA, 2010).

In an OECD 414/GLP study, groups of 24 pregnant female Sprague Dawley rats/dose were administered the test material 10-undecanoic acid via oral gavage at doses of 0, 150, 450, or 750 mg/kg/day in corn oil. The animals were treated daily between days 6–21 postcoitum. Following initiation of the study, there was unexpectedly high mortality among the high-dose group animals, and thus this group was terminated. Animals of the mid-dose group exhibited hypersalivation and a statistically significant decrease in bodyweight gain when compared to the controls. There were no treatment-related alterations among the fetuses as compared to the controls. Thus, the NOAEL for maternal toxicity was considered to be 150 mg/kg/day, based on observed clinical signs of toxicity and decreased bodyweight gain among the mid-dose group dams. The NOAEL for developmental toxicity was considered to be 450 mg/kg/day since no litter was produced at the highest dose (ECHA, 2010).

Taken altogether, the NOAEL for fertility effects was considered to be 450 mg/kg/day, based on the results from the OECD 421 study. The NOAEL for developmental toxicity was considered to be 450 mg/kg/day, based on the results from both the OECD 421 and OECD 414 studies. Therefore, the 10-undecanoic acid MOE for the reproductive toxicity endpoint can be calculated by dividing the 10-undecanoic acid NOAEL in mg/kg/day by the total systemic exposure to 10-undecanoic acid, 450/0.000078 or 5769231.

In addition, the total systemic exposure to 10-undecanoic acid (0.078 μg/kg/day) is below the TTC (30 μg/kg/day; Kroes et al., 2007; Laufersweiler et al., 2012) for the reproductive toxicity endpoint of a Cramer Class I material at the current level of use.

Additional References: None.

Literature Search and Risk Assessment Completed On: 06/07/19.

11.1.4. Skin sensitization

Based on the existing data, the Expert Panel for Fragrance Safety applied the reactive DST for 10-undecenoic acid, and it does not present a concern for skin sensitization under the current, declared levels of use.

11.1.4.1. Risk assessment. The chemical structure of this material indicates that it would not react with skin proteins (Roberts et al., 2007; Toxtree 3.1.0 [Patlewicz et al., 2008]; OECD Toolbox v4.2 [OECD, 2018]). 10-Undecenoic acid was found to be non-reactive in an in vitro direct peptide reactivity assay (DPRA), positive in the KeratinoSens, negative in a human cell line activation test (h-CLAT), and positive in the U-Sens (Bauch et al., 2012; Piroird et al., 2015). In a murine local lymph node assay (LLNA), 10-undecenoic acid was found to be sensitizing with an EC3 value of 19.4% (4850 μg/cm²) (Kreiling et al., 2008). In a human maximization test, no skin sensitization reactions were observed (RIFM, 1976). In a guinea pig maximization test, reactions indicative of skin sensitization were observed in response to 10-undecenoic acid (Kreiling et al., 2008), while no reactions indicative of skin sensitization were observed in another guinea pig maximization test (ECHA, 2010). Acting conservatively, due to the limited data, the reported exposure was benchmarked utilizing the reactive DST of 64 μg/cm² (Safford, 2008; Safford et al., 2011; Roberts et al., 2015; Safford et al., 2015b). The current exposure from the 95th percentile concentration is below the DST for reactive materials when evaluated in all QRA categories. Table 2 provides the maximum acceptable concentrations for 10-undecenoic acid that present no appreciable risk for skin sensitization based on the reactive DST. These levels represent maximum acceptable concentrations based on the DST approach. However, additional studies may show it could be used at higher levels.

Additional References: None.

Literature Search and Risk Assessment Completed On: 06/18/19.

11.1.5. Phototoxicity/photoallergenicity

Based on the available UV/Vis spectra, 10-undecenoic acid would not be expected to present a concern for phototoxicity or photoallergenicity.

11.1.5.1. Risk assessment. There are no phototoxicity studies available for 10-undecenoic acid in experimental models. UV/Vis absorption spectra indicate no significant absorption between 290 and 700 nm. The corresponding molar absorption coefficient is well below the benchmark of concern for phototoxicity and photoallergenicity (Henry et al., 2009). Based on the lack of absorbance, 10-undecenoic acid does not present a concern for phototoxicity or photoallergenicity.

11.1.5.2. UV spectra analysis, UV/Vis absorption spectra (OECD TG 101) were obtained. The spectra indicate no significant absorbance in the range of 290–700 nm. The molar absorption coefficient is below the benchmark of concern for phototoxic effects, 1000 L mol⁻¹ · cm⁻¹ (Henry et al., 2009).

Additional References: None.

Literature Search and Risk Assessment Completed On: 05/08/19.

11.1.6. Local Respiratory Toxicity

The MOE could not be calculated due to a lack of appropriate data. The exposure level for 10-undecenoic acid is below the Cramer Class I TTC value for inhalation exposure local effects.

11.1.6.1. Risk assessment. There are no inhalation data available on 10-undecenoic acid. Based on the Creme RIFM Model, the inhalation exposure is 0.00016 mg/day. This exposure is 8750 times lower than the Cramer Class I TTC value of concern for inhalation exposure local effects.

Additional References: None.

Literature Search and Risk Assessment Completed On: 06/04/19.

11.2. Environmental endpoint summary

11.2.1. Screening-level assessment

A screening-level risk assessment of 10-undecenoic acid was performed following the RIFM Environmental Framework (Salvito et al., 2002), which provides 3 tiered levels of screening for aquatic risk. In Tier 1, only the material’s regional VoU, its log Kow, and its molecular weight are needed to estimate a conservative risk quotient (RQ),
expressed as the ratio Predicted Environmental Concentration/Predicted No Effect Concentration (PEC/PNEC). A general QSAR with a high uncertainty factor applied is used to predict fish toxicity, as discussed in Salvito et al. (2002). In Tier 2, the RQ is refined by applying a lower uncertainty factor to the PNEC using the ECOSAR model (US ECHA, 2012b), which provides chemical class-specific ecotoxicity estimates. Finally, if necessary, Tier 3 is conducted using measured biodegradation and ecotoxicity data to refine the RQ, thus allowing for lower PNEC uncertainty factors. The data for calculating the PEC and PNEC for this safety assessment are provided in Table 3 below. For the PEC, the range from the most recent IFRA Volume of Use Survey is reviewed. The PEC is then calculated using the actual regional tonnage, not the extremes of the range. Following the RIFM Environmental Framework, 10-undecenoic acid was identified as a fragrance material with the potential to present a possible risk to the aquatic environment (i.e., its screening-level PEC/PNEC > 1) (see Table 4).

A screening-level hazard assessment using EPI Suite v4.11 (US ECHA, 2012a) did not identify 10-undecenoic acid as possibly persistent or bioaccumulative based on its structure and physical—chemical properties. This screening-level hazard assessment considers the potential for a material to be persistent and bioaccumulative and toxic, or very persistent and very bioaccumulative as defined in the Criteria Document (Api et al., 2015). As noted in the Criteria Document, the screening criteria applied are the same as those used in the EU for

### Table 2

Note: ¹For a description of the categories, refer to the IFRA/RIFM Information Booklet.

² No reported use.

³ Fragrance exposure from these products is very low. These products are not currently in the Creme RIFM Aggregate Exposure Model.

6
Biodegradation of 94% was observed after 28 days. The manometric respirometry test according to the OECD 301F guideline was conducted. Other available data. 10-undecenoic acid has been registered as a biodegradable material in the EPI Suite v4.11. Data on persistence and bioaccumulation are reported below and summarized in the Environmental Safety Assessment section prior to Section 1.

11.2.2. Risk assessment

Based on the current Volume of Use (IFRA, 2015), 10-undecenoic acid presents a risk to the aquatic compartment in the screening-level assessment.

11.2.2.1. Key studies

11.2.2.1.1. Biodegradation. No data available.

11.2.2.1.2. Ecotoxicity. No data available.

11.2.2.2. Other available data. 10-undecenoic acid has been registered as REACH with additional data available at this time: The ready biodegradability of the test material was evaluated using the manometric respirometry test according to the OECD 301F guideline. Biodegradation of 94% was observed after 28 days. The acute fish toxicity test was conducted using the OECD 203 guideline under semi-static conditions. The 72-h LC50 value based on mean measured concentrations was reported to be 32.3 mg/L (95% Cl: 15.8–47.8 mg/L).

An early-life stage fish (Danio rerio) toxicity test was conducted according to the OECD 210 guideline under semi-static conditions. The 35-day NOEC value based on the mean measured concentration for mortality was reported to be 0.66 mg/L. The Daphnia acute immobilization test was conducted according to the OECD 202 guideline under static conditions. The 48-h EC50 value was reported to be 28 mg/L (95% Cl: 16–38 mg/L).

The Daphnia magna reproduction test was conducted according to the OECD 211 guideline under semi-static conditions. The 21-day EC10 value of 3.7 mg/L was reported for parental mortality (immobilization). The algae growth inhibition test was conducted according to the OECD 201 guideline under static conditions. The 72-h EC50 value based on the mean measured concentration for growth rate was reported to be 0.24 mg/L (ECHA, 2010).

11.2.2.3. Risk assessment refinement

Based on available data, the RQ for this material is < 1. No further assessment is necessary.

The RIFM PNEC is 0.7954 µg/L. The revised PEC/PNECs for EU and NA are <1; therefore, the material does not present a risk to the aquatic environment at the current reported volumes of use.
